

PERHITUNGAN KONSTRUKSI

5.1 DATA PERENCANAAN BANGUNAN

Direncanakan :

- Bentang Jembatan : 80 meter
 - Lebar Jembatan : $9 (1 + 7 + 1)$ meter
 - Jenis Jembatan : Struktur Rangka Baja
 - Bangunan Atas
 - a. Lantai Jembatan
 - Lebar Lantai Jembatan : $2 \times 3,5$ meter
 - Mutu Beton : 25 Mpa
 - Tinggi Plat : 20 cm
 - b. Lantai Trotoar
 - Lebar Lantai Trotoar : 2×1 meter
 - Mutu Beton : 25 Mpa
 - Tinggi Plat : 20 cm
 - Bangunan Bawah
 - a. Abutment
 - Mutu beton : 35 MPa
 - Mutu tulangan : 240 MPa
 - Jenis : Kontraport
 - b. Pelat injak
 - Mutu beton : 35 MPa
 - Mutu tulangan : 240 MPa
 - c. Bangunan pondasi
 - Mutu beton : 40 MPa
 - Mutu tulangan : 240 MPa
 - Jenis : Tiang pancang
-

Gambar 5.1 Penampang Memanjang Jembatan

Gambar 5.2 Penampang Melintang Jembatan

5.2 PERHITUNGAN BANGUNAN ATAS

5.2.1 Perhitungan Sandaran

Railing atau sandaran merupakan pagar untuk pengamanan pengguna jembatan khususnya pejalan kaki. Menurut Pedoman Perencanaan Pembebanan Jembatan Jalan Raya halaman 10 :

Tiang-tiang sandaran pada setiap tepi trotoar harus diperhitungkan untuk dapat menahan beban horizontal sebesar 100 kg/m' yang bekerja pada tinggi 90 cm diatas lantai trotoir.

Jika gelagar melintang diasumsikan menggunakan IWF 708x302x15x28-215 dan rangka induk diasumsikan menggunakan IWF 428x407x20x35-283 maka tinggi sandaran dari sumbu bawah rangka induk dihitung sebagai berikut :

- h1 = tinggi sandaran dari trotoar = 900 mm
- h2 = tinggi trotoar = 250 mm
- h3 = tinggi plat lantai kendaraan = 200 mm
- h4 = tinggi gelagar melintang = 890 mm (IWF 708x302x15x28-215)
- h5 = tebal sayap gelagar melintang = 23 mm
- h6 = lebar profil rangka induk = 407 mm (IWF 428x407x20x35-283)

Gambar 5.3 Tinggi Tiang Sandaran

$$\begin{aligned} h_s &= h_1 + h_2 + h_3 + (h_4 - h_5 - (1/2 \times h_6)) \\ &= 708 + 250 + 200 + (708 - 23 - (1/2 \times 407)) \\ &= 1639,5 \text{ mm} \end{aligned}$$

sedangkan tinggi total rangka adalah 6.3 meter

Sandaran diasumsikan mempunyai sendi pada rangka utama dengan panjang sandaran yang menumpu pada rangka utama sebesar (pada tengah bentang) :

Dengan menggunakan rumus segitiga :

$$\frac{5000}{6300} = \frac{Ls}{(6300 - 1639,5)}$$

$$Ls = \frac{(5000 \times 4660,5)}{6300}$$

$$= 3698,809 \text{ mm} = 369,880 \text{ cm}$$

Pembebanan pada pipa sandaran :

- Beban horizontal (H) = 100 kg/m
- Beban vertikal (V) = 7,13 kg/m (berat sendiri pipa sandaran)

Sandaran direncanakan menggunakan pipa ϕ 76,3 mm (3 inchi).

a. Data Perencanaan

$$\sigma_{\text{ijin}} = 160 \text{ MPa}$$

$$E_{\text{baja}} = 2,1 \times 10^5 \text{ MPa}$$

b. Data Teknis Profil

$$D = 7,63 \text{ cm}$$

$$t = 0,4 \text{ cm}$$

$$F = 9,085 \text{ cm}^2$$

$$G = 7,13 \text{ kg/m}$$

$$I = 59,5 \text{ cm}^4$$

$$i = 2,60 \text{ cm}$$

$$W = 15,6 \text{ cm}$$

$$\begin{aligned} R &= \sqrt{V^2 + H^2} \\ &= \sqrt{7,13^2 + 100^2} \\ &= 100,254 \text{ kg/m} \end{aligned}$$

$$\begin{aligned} R_{AV} &= \frac{1}{2} \times q \times Ls \\ &= \frac{1}{2} \times 100,254 \times 3,698 = 185,369 \text{ kg} \end{aligned}$$

Momen yang terjadi pada pipa sandaran :

$$\begin{aligned} Mu &= \frac{1}{8} \times q \times Ls^2 \\ &= \frac{1}{8} \times 100,254 \times 3,698^2 = 171,374 \text{ kgm} \end{aligned}$$

Geser yang terjadi pada pipa sandaran :

$$\begin{aligned} D &= \frac{1}{2} \times q \times Ls \\ &= \frac{1}{2} \times 100,254 \times 3,698 = 185,369 \text{ kg} \end{aligned}$$

c. Kontrol terhadap Bahan dan Tegangan yang Ada

1) Terhadap lendutan

$$\frac{5 x q h x l^4}{384 E I} < \frac{l}{180}$$

$$\frac{5 x 1,003 x 369,8^4}{384 x 2,1 x 10^6 x 59,5} = 1,95 \text{ cm} < \frac{l}{180} = \frac{369,8}{180} = 2,054 \text{ cm...OK}$$

2) Terhadap momen

$$\sigma_u < \sigma_{\text{ijin}}$$

$$\frac{Mu}{W} = \sigma_{\text{ijin}}$$

$$\frac{17137,4}{15,6} = 1098,55 \text{ kg/cm}^2 < 1600 \text{ kg/cm}^2 \text{....OK}$$

3) Terhadap geser

$$\tau = \frac{DxS}{l} = \frac{185,369 x 15,6}{59,5} = 48,600 \text{ kg/cm}^2$$

$$\tau_{\text{ijin}} = 0,58 x \sigma_{\text{ijin}} = 0,58 x 1600 = 928 \text{ kg/cm}^2$$

$$\tau < \tau_{\text{ijin}} \text{OK}$$

Jadi pipa ϕ 76,3 (3 inchi) dapat dipakai untuk sandaran.

5.2.2 Perhitungan Lantai Trotoar

Fungsi utama trotoar adalah memberikan layanan yang optimal bagi pejalan kaki baik dari segi keamanan maupun kenyamanan. Berdasar PPJJR 1987 : Kontruksi trotoar harus diperhitungkan terhadap beban hidup (q) = 500 kg/m², Kerb yang terdapat pada tepi – tepi lantai kendaraan diperhitungkan untuk dapat menahan beban satu horisontal ke arah melintang jembatan sebesar (P) = 500 kg/m² yang bekerja pada puncak kerb yang bersangkutan atau pada tinggi 25 cm diatas permukaan lantai kendaraan apabila kerb lebih tinggi dari 25 cm.

Gambar 5.4 Pembebanan pada Trotoar

a. Data Perencanaan

- $f'_c = 25 \text{ MPa}$
- $\gamma_c = 2500 \text{ kg/m}^3$
- $f_y = 240 \text{ MPa}$
- $\phi = 16 \text{ mm}$
- $d = h - p - \frac{1}{2} \phi \text{ tulangan}$
 $= 250 - 40 - 8 = 202 \text{ mm}$

b. Pembebanan

1) Akibat Beban Mati

- P_1 (berat trotoar) $= 0,25 \times 1,00 \times 1,00 \times 2500 = 625 \text{ kg}$
- P_2 (berat pelat jembatan) $= 0,20 \times 1,00 \times 1,00 \times 2500 = 500 \text{ kg}$

2) Akibat Beban Hidup

- H_1 (beban pejalan kaki) $= 1,00 \times 500 = 500 \text{ kg}$
- H_2 (beban tumbukan (pada trotoar)) $= 1,00 \times 500 = 500 \text{ kg}$

3) Akibat Momen yang terjadi di titik A

- $MP_1 = 625 \times 0,5 = 312,5 \text{ kgm}$
- $MP_2 = 500 \times 0,5 = 250 \text{ kgm}$
- $MH_1 = 500 \times 0,5 = 250 \text{ kgm}$
- $MH_2 = 500 \times 0,45 = 225 \text{ kgm} +$
 $M \text{ total } (Mu) = 1037,5 \text{ kgm}$

c. Perhitungan Tulangan

$$\frac{Mu}{bd^2} \times 10^{-2} = \rho \times 0,8 \times f_y \left(1 - 0,588 \times \rho \times \frac{f_y}{f'_c}\right)$$

$$\frac{1037,5}{1 \times 0,202^2} \times 10^{-2} = \rho \times 0,8 \times 2400 \left(1 - 0,588 \times \rho \times \frac{2400}{250}\right)$$

$$9031 \rho^2 - 1920 \rho + 2,543 = 0$$

$$\rho = 0,0013$$

$$\rho_{\min} = \frac{1,4}{f_y} = \frac{1,4}{240} = 0,0058$$

$$\rho_{\max} = 0,75 \times \beta_1 \left(\frac{0,85 f'_c}{f_y} \times \frac{600}{600 + f_y} \right) \text{ dan } \beta_1 = 0,85$$

$$\rho_{\max} = 0,75 \times 0,85 \left(\frac{0,85 \times 250}{2400} \times \frac{600}{600 + 2400} \right) \text{ dan } \beta_1 = 0,85$$

$$\rho_{\max} = 0,013$$

Karena $\rho_{\min} > \rho \rightarrow$ dipakai $\rho_{\min} = 0,0058$

$$A = \rho \times b \times d = 0,0058 \times 1000 \times 202 = 1171,6 \text{ mm}^2$$

Dipakai tulangan ϕ 16 - 150 ($A_s = 1340 \text{ mm}^2$)

Checking :

$$\rho = \frac{A_{s \text{ terpasang}}}{(b \times d)}$$

$$\frac{1340}{(1000 \times 202)} = 0,0087 < \rho_{\max} \dots \text{OK}$$

Menurut SKSNI T15-1991-03 pasal 3.16.12, dalam arah tegak lurus terhadap tulangan utama harus disediakan tulangan pembagi (untuk tegangan susut dan suhu)

\rightarrow untuk $f_y = 240 \text{ MPa}$

$$A_s = 0,0025 \times b \times d$$

$$A_s = 0,0025 \times 1000 \times 202 = 505 \text{ mm}^2$$

Digunakan tulangan bagi D12-200 ($A = 565 \text{ mm}^2$)

5.2.3 Perencanaan Pelat Lantai Kendaraan

Gambar 5.5 Pelat Lantai Kendaraan

a. Data Perencanaan

- Mutu Beton (f^c) = 25 MPa
- Mutu Tulangan (f_y) = 240 MPa
- Tebal Pelat Lantai = 20 cm
- Tebal Perkerasan = 5 cm
- ϕ tulangan rencana = 14 mm
- Tebal Selimut Beton (p) = 40 mm (untuk konstruksi lantai yang langsung berhubungan dengan cuaca)
- Berat jenis beton (γ^c) = $25 \text{ kN/m}^3 = 2500 \text{ kg/m}^3$
- Berat jenis aspal (γ^a) = $22 \text{ kN/m}^2 = 2200 \text{ kg/m}^3$

b. Perhitungan Momen Lentur Pada Pelat Lantai Kendaraan

1) Akibat Beban Mati :

- Berat sendiri pelat = $0,20 \times 1,00 \times 2500$ = 500 kg/m
- Berat aspal = $0,05 \times 1,00 \times 2200$ = 110 kg/m
- Berat air hujan = $0,05 \times 1,00 \times 1000$ = 50 kg/m +

$$\sum qD_L = 660 \text{ kg/m}$$

$$\begin{aligned} \text{Momen Tumpuan} = \text{Momen Lapangan} &= \frac{1}{10} \times q \times L^2 \\ &= \frac{1}{10} \times 660 \times 1,75^2 \\ &= 202,125 \text{ kgm} \end{aligned}$$

2) Akibat Beban Hidup (T) :

Untuk perhitungan kekuatan lantai kendaraan atau sistem lantai kendaraan jembatan harus digunakan beban " T " yaitu beban yang merupakan kendaraan truck yang mempunyai beban roda ganda (*Dual Wheel Load*) sebesar 10 ton.

Gambar 5.6 Beban " T "

- o Beban " T " = 10 ton
- o Bidang kontak pada sumbu plat
- o Penyebaran Beban " T "

$$T' = \frac{10000}{0,8 \times 0,6} = 20833,333 \text{ kg/m}^2$$

- Kondisi 1 (satu roda ditengah pelat)

Gambar 5.7 Penyebaran Beban " T " pada Kondisi 1

$$\begin{aligned} \circ \quad t_x &= 0,80 \text{ m} & \frac{t_x}{L_x} &= \frac{0,8}{1,75} = 0,457 \\ \circ \quad t_y &= 0,60 \text{ m} \\ \circ \quad L_x &= 1,75 \text{ m} & \frac{t_y}{L_y} &= \frac{0,6}{1,75} = 0,343 \\ \circ \quad L_y &= 5,00 \text{ m} \end{aligned}$$

Dari tabel Bittner :

$$\begin{aligned} F_{xm} &= 0,1529 \\ F_{ym} &= 0,0865 \end{aligned}$$

Momen maksimum pada kondisi 1 (satu roda ditengah pelat) :

$$\begin{aligned} M_{xm} &= f_{xm} \times T' \times t_x \times t_y \\ &= 0,1529 \times 20833,333 \times 0,8 \times 0,6 \\ &= 1529,000 \text{ kgm} \\ M_{ym} &= F_{ym} \times T' \times t_x \times t_y \end{aligned}$$

$$= 0,0865 \times 20833,333 \times 0,8 \times 0,6$$

$$= 865,000 \text{ kg}$$

- Kondisi 2 (dua roda berdekatan)

Gambar 5.8 Penyebaran Beban " T " pada Kondisi 2

Luas bidang kontak diatas dapat dihitung menjadi 2 bagian, yaitu :

▪ Bagian 1

$$\circ t_x = 1,75 \text{ m}$$

$$\circ t_y = 0,6 \text{ m}$$

$$\frac{t_x}{l_x} = \frac{1,75}{1,75} = 1,0$$

$$\circ l_x = 1,75 \text{ m} \qquad \frac{t_y}{l_x} = \frac{0,6}{1,75} = 0,343$$

$$\circ l_y = 5 \text{ m}$$

Dari tabel Bittner diperoleh :

$$f_{xm} = 0,0904$$

$$f_{ym} = 0,0572$$

Momen yang terjadi :

$$\begin{aligned} M_{xm1} &= f_{xm} \times T' \times t_x \times t_y \\ &= 0,0904 \times 20833,333 \times 1,75 \times 0,6 \\ &= 1977,500 \text{ kgm} \end{aligned}$$

$$\begin{aligned} M_{ym1} &= f_{ym} \times T' \times t_x \times t_y \\ &= 0,0572 \times 20833,333 \times 1,75 \times 0,6 \\ &= 1251,250 \text{ kgm} \end{aligned}$$

▪ Bagian 2

$$\circ t_x = 0,3 \text{ m} \quad \Rightarrow \quad \frac{t_x}{l_x} = \frac{0,3}{1,75} = 0,171$$

$$\circ t_y = 0,6 \text{ m}$$

$$\circ l_x = 1,75 \text{ m} \qquad \frac{t_y}{l_x} = \frac{0,6}{1,75} = 0,343$$

$$\circ l_y = 5 \text{ m}$$

Dari tabel Bittner diperoleh :

$$f_{xm} = 0,2106$$

$$f_{ym} = 0,1043$$

Momen yang terjadi :

$$\begin{aligned} M_{xm2} &= f_{xm} \times T' \times t_x \times t_y \\ &= 0,2106 \times 20833,333 \times 0,3 \times 0,6 \\ &= 789,750 \text{ kgm} \end{aligned}$$

$$M_{ym2} = f_{ym} \times T' \times t_x \times t_y$$

$$\begin{aligned}
 &= 0,1043 \times 20833,333 \times 0,3 \times 0,6 \\
 &= 391,125 \text{ kgm}
 \end{aligned}$$

Momen maksimum pada kondisi 2 :

$$\begin{aligned}
 M_{xm} &= M_{xm1} - M_{xm2} \\
 &= 1977,5 - 789,75 \\
 &= 1187,750 \text{ kgm} \\
 M_{ym} &= M_{ym1} - M_{ym2} \\
 &= 1251,25 - 391,125 \\
 &= 860,125 \text{ kgm}
 \end{aligned}$$

Momen maksimum akibat beban hidup “T” diambil dari momen terbesar pada kondisi 1 dan kondisi 2, yaitu :

- Momen maksimum pada kondisi 1 (satu roda ditengah pelat) :

$$\begin{aligned}
 M_{xm} &= 1529,000 \text{ kgm} \\
 M_{ym} &= 865,000 \text{ kgm}
 \end{aligned}$$

- Momen maksimum pada kondisi 2 (dua roda berdekatan) :

$$\begin{aligned}
 M_{xm} &= 1187,750 \text{ kgm} \\
 M_{ym} &= 860,125 \text{ kgm}
 \end{aligned}$$

Dipilih momen pada kondisi 1 (satu roda ditengah pelat), karena menghasilkan nilai momen yang terbesar.

Momen total yang terjadi pada pelat tengah akibat beban mati dan beban hidup adalah :

$$\begin{aligned}
 M_X &= M_{xDL} + M_{xLL} \\
 &= 202,125 + 1529,000 \\
 &= 1731,125 \text{ kgm} \\
 M_Y &= M_{yDL} + M_{yLL} \\
 &= 202,125 + 865,000 \\
 &= 1067,125 \text{ kgm}
 \end{aligned}$$

c. Perhitungan Tulangan Pelat Lantai Kendaraan

- Tulangan pada arah melintang jembatan (lx)

$$M_x = \frac{M_x}{\phi}, \phi = 0,8 \text{ (factor reduksi untuk menahan momen lentur)}$$

$$M_x = \frac{1731,125}{0,8} = 2163,906 \text{ kgm} = 21,639 \text{ Nm}$$

$$b = 1,00 \text{ m}$$

$$d = h - p - \left(\frac{1}{2} \phi \right)$$

$$= 200 - 40 - 8 = 152 \text{ mm} = 0,152 \text{ m}$$

$$\frac{M_x}{bd^2} = \frac{21,639}{1,00 \times 0,152^2} = 936,753 \text{ kN/m}^2 = 0,936753 \text{ Mpa}$$

$$\frac{M_x}{bd^2} = \rho \times 0,8 \times f_y \times \left(1 - 0,588 \times \rho \times \frac{f_y}{f'_c} \right)$$

$$0,947 = \rho \times 0,8 \times 240 \times \left(1 - 0,588 \times \rho \times \frac{240}{25} \right)$$

$$0,947 = 192 \rho (1 - 5,645 \rho)$$

$$1083,84 \rho^2 - 192 \rho + 0,947 = 0$$

$$\rho_1 = 0,0051$$

$$\rho_2 = 0,172$$

$$\rho_{balance} = \left(\frac{0,85 \times f'_c \times \beta_1}{f_y} \right) \times \left(\frac{600}{600 + f_y} \right)$$

$$= \left(\frac{0,85 \times 25 \times 0,85}{240} \right) \times \left(\frac{600}{600 + 240} \right)$$

$$= 0,0645$$

$$\rho_{max} = 0,75 \times \rho_{balance}$$

$$= 0,75 \times 0,0645 = 0,0483$$

$$\rho_{min} = \frac{1,4}{f_y} = \frac{1,4}{240} = 0,00583$$

Syarat, $\rho_{\min} < \rho < \rho_{\max}$, karena $\rho < \rho_{\min}$ maka digunakan
 $\rho = \rho_{\min} = 0,00583$

$$\begin{aligned} A_s &= \rho \times b \times d \times 10^6 \\ &= 0,00583 \times 1,00 \times 0,152 \times 10^6 \\ &= 886,16 \text{ mm}^2 \end{aligned}$$

Digunakan tulangan Ø 14 – 150 ($A_s = 1026 \text{ mm}^2$)

- Tulangan pada arah memanjang jembatan (ly)

$$M_y = \frac{My}{\phi}, \phi = 0,8 \text{ (factor reduksi untuk menahan momen lentur)}$$

$$M_y = \frac{1067,125}{0,8} = 1333,906 \text{ kgm} = 13,33906 \text{ kNm}$$

$$b = 1,00 \text{ m}$$

$$\begin{aligned} d &= h - p - \phi_{tul} \times \left(\frac{1}{2} \phi \right) \\ &= 200 - 40 - 16 - 8 = 136 \text{ mm} = 0,136 \text{ m} \end{aligned}$$

$$\frac{My}{bd^2} = \frac{13,33906}{1,00 \times 0,136^2} = 724,948 \text{ kN/m}^2 = 0,742948 \text{ Mpa}$$

$$\frac{My}{bd^2} = \rho \times 0,8 \times f_y \times \left(1 - 0,588 \times \rho \times \frac{f_y}{f'_c} \right)$$

$$0,743 = \rho \times 0,8 \times 240 \times \left(1 - 0,588 \times \rho \times \frac{240}{25} \right)$$

$$0,743 = 192\rho(1 - 5,645\rho)$$

$$1083,84\rho^2 - 192\rho + 0,743 = 0$$

$$\rho_1 = 0,00325, \quad \rho_2 = 0,174$$

$$\begin{aligned} \rho_{balance} &= \left(\frac{0,85 \times f'_c \times \beta_1}{f_y} \right) \times \left(\frac{600}{600 + f_y} \right) \\ &= \left(\frac{0,85 \times 25 \times 0,85}{240} \right) \times \left(\frac{600}{600 + 240} \right) = 0,0645 \end{aligned}$$

$$\begin{aligned}\rho_{\max} &= 0,75 \times \rho_{\text{balance}} \\ &= 0,75 \times 0,0645 = 0,0483\end{aligned}$$

$$\rho_{\min} = \frac{1,4}{f_y} = \frac{1,4}{240} = 0,00583$$

Syarat, $\rho_{\min} < \rho < \rho_{\max}$, karena $\rho < \rho_{\min}$ maka digunakan

$$\rho = \rho_{\min} = 0,00583$$

$$\begin{aligned}A_s &= \rho \times b \times d \times 10^6 \\ &= 0,00583 \times 1,00 \times 0,136 \times 10^6 \\ &= 792,88 \text{ mm}^2\end{aligned}$$

Digunakan tulangan Ø 12 – 125 ($A_s = 905 \text{ mm}^2$)

d. Cek Deck Slab

Direncanakan menggunakan dek baja type Ribdeck 80 dengan dimensi sebagai berikut :

$$t = 1,2 \text{ mm}$$

$$W = 14,8 \text{ kg/m}^2$$

$$A = 1,848 \text{ mm}^2$$

$$I = 237,6 \text{ cm}^4$$

$$Y_{NA} = 42,5 \text{ mm} = 4,25 \text{ cm}$$

Mencari momen lawan (W_x)

$$\begin{aligned}y_2 &= \frac{80^2 \times 185 - 1,2(80 - 1,2)^2}{2 \times (80^2 \times 185 - 1,2(80 - 1,2))} \times 3 \\ &= \frac{80^2 \times 185 - 1,2(80 - 1,2)^2}{2 \times (80^2 \times 185 - 1,2(80 - 1,2))} \times 3 = 1,488 \text{ mm} = 0,148 \text{ cm}\end{aligned}$$

$$y_1 = 80 - 1,488 = 78,512 \text{ mm} = 7,851 \text{ cm}$$

$$W_1 = \frac{237,6}{0,148} = 1605,405 \text{ cm}^3$$

$$W_2 = \frac{237,6}{7,851} = 30,263 \text{ cm}^3$$

Untuk W_x dipakai $W_2 = 30,263 \text{ cm}^3$

Cek tegangan yang terjadi :

$$\begin{aligned} \sigma_{\text{terjadi}} &= \frac{M}{W_x} < \bar{\sigma} \\ &= \frac{2163,906}{30,263} < 1867 \text{ kg/cm} \\ &= 71,503 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots \dots \text{OK} \end{aligned}$$

5.2.4 Perencanaan Gelagar Memanjang

Gelagar jembatan berfungsi untuk menerima beban-beban yang bekerja diatasnya dan menyalurkannya ke bangunan dibawahnya. Pembebanan pada gelagar memanjang meliputi :

- Beban mati

Beban mati terdiri dari berat sendiri gelagar dan beban-beban yang bekerja diatasnya (pelat lantai jembatan, perkerasan, dan air hujan)

- Beban hidup

Beban hidup pada gelagar jembatan dinyatakan dengan beban “D” atau beban jalur, yang terdiri dari beban terbagi rata “q” ton per meter panjang per jalur, dan beban garis “P” ton per jalur lalu lintas tersebut.

Gambar 5.9 Pemodelan Beban Gelagar Memanjang

Data teknis perencanaan gelagar memanjang :

- Mutu beton ($f'c$) = 25 Mpa
- Mutu baja (f_y) = 240 Mpa
- Berat isi beton bertulang = 2500 kg/m³
- Berat isi beton biasa = 2200 kg/m³
- Berat isi aspal = 2200 kg/m³
- Tebal pelat lantai kendaraan = 20 cm
- Tebal lapis perkerasan = 5 cm
- Tinggi trotoar = 25 cm
- Jarak antar gelagar melintang = 500 cm

5.2.4.1 Gelagar tepi

Gambar 5.10 Pembebanan Pada Gelagar Tepi

1. Perhitungan momen lentur pada gelagar tepi

a. Beban mati

- Beban mati (q_{D1}) akibat pelat lantai trotoar dan beban di atasnya :
 - Berat Trotoar = $0,25 \times 1,00 \times 2500 = 625 \text{ kg/m}$

- Berat Pelat lantai = $0,20 \times 1,00 \times 2500$ = 500 kg/m
 - Berat air hujan = $0,05 \times 1,00 \times 1000$ = 50 kg/m
 - Berat Dek Baja = $1,00 \times 11,35$ = 11,35 kg/m +
- $qD1 = 1311,35 \text{ kg/m}$

- Beban mati akibat ($qD2$) pelat lantai trotoar dan beban di atasnya :

- Berat Perkerasan = $0,05 \times 0,875 \times 2200$ = 96,25 kg/m
 - Berat Pelat lantai = $0,20 \times 0,875 \times 2500$ = 437,5 kg/m
 - Berat air hujan = $0,05 \times 0,875 \times 1000$ = 50 kg/m
 - Berat Dek Baja = $0,875 \times 11,35$ = 9,931 kg/m +
- $qD2 = 593,681 \text{ kg/m}$

Beban Trapezium diubah menjadi beban Ekuivalen :

$$\frac{qD2}{24} \times (3L^2 - 4a^2) = \frac{qE}{8} \times L^2$$

$$\frac{593,681}{24} \times (3 \times 5^2 - 4 \times 0,875^2) = \frac{qE}{8} \times 5^2$$

$$q_E = 569,439 \text{ kg/m}$$

- Berat Sendiri Profil Gelagar Memanjang (q_{D3}) = 49,6 kg/m
(Diasumsikan menggunakan profil IWF 350 x 175 x 7 x 11 – 49,6)

$$\begin{aligned} \text{Jadi beban Mati Total (} q_{DL} \text{)} &= q_{D1} + q_E + q_{D3} \\ &= 1311,35 + 569,439 + 49,6 \\ &= 1930,389 \text{ kg/m} \end{aligned}$$

Gaya geser maksimum akibat beban mati ($D_{mak DL}$) :

$$\begin{aligned} D_{mak DL} &= \frac{1}{2} \times q \times L \\ &= \frac{1}{2} \times 1930,389 \times 5 \\ &= 4825,973 \text{ kg} \end{aligned}$$

Momen maksimum akibat beban mati ($M_{mak DL}$) :

$$\begin{aligned} M_{max DL} &= \frac{1}{8} \times q_{DL} \times L^2 \\ &= \frac{1}{8} \times 1930,389 \times 5^2 \\ &= 6032,465 \text{ kgm} \end{aligned}$$

b. Beban Hidup

- **Beban terbagi rata (“q”)**

Bentang jembatan = 80 m, maka :

$$\begin{aligned} q &= 1.1 (1 + 30/L) \text{ t/m'} \quad \text{untuk } L > 60 \text{ m} \\ &= 1.1 (1 + 30/80) \text{ t/m'} = 1,65 \text{ t/m} \end{aligned}$$

Untuk perhitungan momen dan gaya lintang :

$$\text{Beban terbagi rata (q')} = \frac{q}{2,75} \times \alpha \times s' \quad , \quad \text{dimana :}$$

α = faktor distribusi, $\alpha = 0,75$ bila kekuatan gelagar melintang diperhitungkan, $\alpha = 1,00$ bila kekuatan gelagar melintang tidak diperhitungkan

s' = lebar pengaruh beban hidup pada gelagar tepi

$$s' = \frac{1,750 \times 1}{2} = 0,875$$

$$\begin{aligned} q' &= \frac{q}{2,75} \times \alpha \times s' \\ &= \frac{1,65}{2,75} \times 0,75 \times 0,875 = 0,525 \text{ t/m} = 525 \text{ kg/m} \end{aligned}$$

Ketentuan penggunaan beban “D” dalam arah melintang jembatan :

- o Untuk jembatan dengan lebar lantai kendaraan lebih besar dari 5,50 meter, beban “D” sepenuhnya (100%) dibebankan pada lebar jalur 5,50 meter sedang lebar selebihnya dibebani hanya separuh beban “D” (50%).

$$q' = 50 \% \times 525 \text{ kg/m} = 262,5 \text{ kg/m}$$

- o Untuk perhitungan kekuatan gelagar karena pengaruh beban hidup pada trotoar, diperhitungkan beban sebesar 60% beban hidup trotoar.

$$\text{Beban hidup pada trotoar} = 500 \text{ kg/m}^2$$

Pengaruh beban hidup pada trotar (q)

$$q = 60\% \times (1,00 \times 500) = 300 \text{ kg/m}$$

Beban Hidup terbagi rata pada gelagar tepi :

$$q' = 262,25 + 300 = 562,25 \text{ kg/m}$$

• Beban garis “P”

$P = 12 \text{ ton}$, Untuk perhitungan momen dan gaya lintang :

$$\text{Beban garis (P')} = \frac{P}{2,75} \times \alpha \times s' \times K \quad \text{dimana :}$$

K = koefisien kejut, yang ditentukan dengan rumus :

$$K = 1 + \left(\frac{20}{(50 + L)} \right) = 1 + \left(\frac{20}{(50 + 80)} \right) = 1,153$$

$$P' = \frac{P}{2,75} \times \alpha \times s' \times K = \frac{12}{2,75} \times 0,75 \times 0,875 \times 1,153$$

$$= 3,302 \text{ T} = 3302 \text{ kg}$$

Untuk jembatan dengan lebar lantai kendaraan lebih besar dari 5,50 meter, beban “D” sepenuhnya (100%) dibebankan pada lebar jalur 5,50 meter sedang lebar selebihnya dibebani hanya separuh beban “D” (50%).

$$P' = 50 \% \times 3302 = 1651 \text{ kg}$$

Gaya geser maksimum akibat beban hidup (Dmak LL) :

$$D_{makLL} = \frac{1}{2} p' + \frac{1}{2} q' L$$

$$= \left(\frac{1}{2} \times 1651 \right) + \left(\frac{1}{2} \times 562,25 \times 5 \right)$$

$$= 2231,125 \text{ kg}$$

Momen maksimum akibat beban hidup (Mmak LL) :

$$M_{maxLL} = \left(\frac{1}{8} \times q' \times l^2 \right) + \left(\frac{1}{4} \times P \times l \right)$$

$$= \left(\frac{1}{8} \times 562,25 \times 5^2 \right) + \left(\frac{1}{4} \times 1651 \times 5 \right)$$

$$= 3820,781 \text{ kgm}$$

Gaya geser total pada gelagar tepi :

$$D_{tot} = D_{makDL} + D_{makLL}$$

$$= 4825,973 \text{ kg} + 2231,125 \text{ kg}$$

$$= 7057,098 \text{ kg}$$

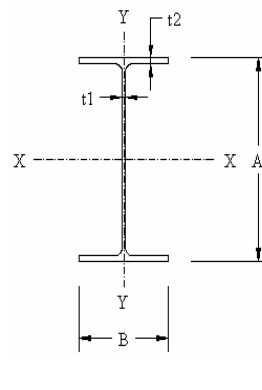

Momen total pada gelagar tepi :

$$\begin{aligned}
 M_{tot} &= M_{\max DL} + M_{\max LL} \\
 &= 6032,465 \text{ kgm} + 3820,781 \text{ kgm} \\
 &= 9853,246 \text{ kgm}
 \end{aligned}$$

2. Pendimensian profil gelagar tepi

$$\begin{aligned}
 M_{tot} &= 9853,246 \text{ kgm} = 985324,6 \text{ kgcm} \\
 \bar{\sigma}_{Bj 44} &= 1867 \text{ kg/cm}^2 \\
 W_x &= \frac{M_{tot}}{\bar{\sigma}} = \frac{985324,6}{1867} = 527,758 \text{ cm}^3
 \end{aligned}$$

Digunakan profil baja IWF 350 × 175 x 7 x 11 – 49,6

	Profil WF	Berat (kg/m)	Ukuran (mm)				
			A	B	t1	t2	r
	350 x 175	49,6	350	175	7	11	14

Luas tampang	Momen Inersia		Jari-jari Inersia		Momen Lawan	
	Ix	Iy	ix	iy	Wx	Wy
63,14	13600	984	14,7	3,95	775	112

3. Kontrol terhadap bahan dan tegangan

- Kontrol terhadap lendutan (δ)

$$\begin{aligned}
 \delta_{\max} &= \frac{5 \times q_{tot} \times L^4}{384 EI_x} + \frac{P \times L^3}{48 EI_x} < \delta_{ijin} \\
 &= \frac{5 \times (19,303 + 5,623) \times 500^4}{384 \times (2,1 \times 10^6) \times 13600} + \frac{1651 \times 500^3}{48 \times (2,1 \times 10^6) \times 13600} < \frac{L}{500} \\
 &= 0,712 + 0,150 < 1,00 \text{ cm} \\
 &= 0,862 \text{ cm} < 1,00 \text{ cm} \dots \dots \dots \text{OK}
 \end{aligned}$$

- Kontrol terhadap tegangan lentur yang terjadi (σ) :

$$\sigma_{terjadi} = \frac{M_{tot}}{W_x} < \bar{\sigma}$$

$$\begin{aligned}
 &= \frac{985324,6}{775} < 1867 \text{ kg/cm} \\
 &= 1271,386 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots\dots\dots \mathbf{OK}
 \end{aligned}$$

- Kontrol terhadap tegangan geser yang terjadi (τ)

$$\begin{aligned}
 D_{\max} &= \left(\frac{1}{2} \times q_{\text{tot}} \times L \right) + \left(\frac{1}{2} \times P \right) \\
 &= \left(\frac{1}{2} \times (19,303 + 5,623) \times 500 \right) + \left(\frac{1}{2} \times 1651 \right) \\
 &= 7057 \text{ kg}
 \end{aligned}$$

$$\begin{aligned}
 A_{\text{web}} &= A_{\text{profil}} - A_{\text{flens}} \\
 &= 63,14 - (2 \times (17,5 \times 1,1)) \\
 &= 24,64 \text{ cm}^2
 \end{aligned}$$

$$\begin{aligned}
 \tau_{\text{terjadi}} &= \frac{D_{\max}}{A_{\text{web}}} < \bar{\tau} \\
 &= \frac{7057}{24,64} < 0,58 \times \bar{\sigma} \\
 &= 286,404 \text{ kg/cm}^2 < 1082,86 \text{ kg/cm}^2 \dots\dots\dots \mathbf{OK}
 \end{aligned}$$

5.2.4.2 Gelagar tengah

Gambar 5.11 Penampang Melintang Gelagar Tengah

1) Perhitungan momen lentur pada gelagar tengah

a. Beban mati

- Berat lapis perkerasan = $0,05 \times 0,875 \times 2200 = 96,25 \text{ kg/m}$
- Berat pelat lantai kendaraan = $0,20 \times 0,875 \times 2500 = 437,50 \text{ kg/m}$
- Berat air hujan = $0,05 \times 0,875 \times 1000 = 43,75 \text{ kg/m}$
- Berat profil dan dek baja = $0,875 \times 11,35 = 9,931 \text{ kg/m} +$
 $q_{DL} = 587,431 \text{ kg/m}$

Beban Trapezium diubah menjadi beban Ekuivalen :

$$\frac{qDL}{24} \times (3L^2 - 4a^2) = \frac{qE}{8} \times L^2$$

$$\frac{587,431}{24} \times (3 \times 5^2 - 4 \times 0,875^2) = \frac{qE}{8} \times 5^2$$

$$qE = 563,444 \text{ kg/m}$$

$$\begin{aligned} \text{Beban mati yang bekerja pada gelagar Tengah} &= 2 \times qE \\ &= 2 \times 563,444 \\ &= 1126,888 \text{ kg/m} \end{aligned}$$

$$\text{Berat Sendiri Profil Gelagar Memanjang} = 49,6 \text{ kg/m}$$

(Diasumsikan menggunakan profil IWF 350 x 175 x 7 x 11 – 49,6)

$$\begin{aligned} \text{Beban Mati Total (} qDL \text{)} &= 1126,888 + 49,6 \\ &= 1176,480 \text{ kg/m} \end{aligned}$$

Gaya Geser maksimum akibat beban mati (Dmak DL) :

$$\begin{aligned} D_{\text{mak DL}} &= \frac{1}{2} \times q \times L \\ &= \frac{1}{2} \times 1176,480 \times 5 \\ &= 2941,2 \text{ kg} \end{aligned}$$

Momen maksimum akibat beban mati (Mmax DL) :

$$\begin{aligned} M_{\text{max DL}} &= \frac{1}{8} \times q_{DL} \times l^2 \\ &= \frac{1}{8} \times 1176,480 \times 5^2 \\ &= 3676,5 \text{ kgm} \end{aligned}$$

b. Beban Hidup

- Beban terbagi rata (“q”)**

Bentang jembatan = 80 m, maka :

$$q = 1.1 (1 + 30/L) \text{ t/m'} \quad \text{untuk } L > 60 \text{ m}$$

$$= 1.1 (1 + 30/80) \text{ t/m'} = 1,65 \text{ t/m}$$

Untuk perhitungan momen dan gaya lintang :

$$\text{Beban terbagi rata (q')} = \frac{q}{2,75} \times \alpha \times s'$$

dimana :

α = faktor distribusi, $\alpha = 0,75$ bila kekuatan gelagar melintang diperhitungkan, $\alpha = 1,00$ bila kekuatan gelagar melintang tidak diperhitungkan

s' = lebar pengaruh beban hidup pada gelagar tepi = 1,75 m

$$q' = \frac{1,65}{2,75} \times 0,75 \times 1,75 = 0,7875 \text{ t/m} = 787,5 \text{ kg/m}$$

Ketentuan penggunaan beban “D” dalam arah melintang jembatan :

- Untuk jembatan dengan lebar lantai kendaraan lebih besar dari 5,50 meter, beban “D” sepenuhnya (100%) dibebankan pada lebar jalur 5,50 meter sedang lebar selebihnya dibebani hanya separuh beban “D” (50%).

Beban Hidup terbagi rata pada gelagar tengah :

$$q' = 100 \% \times 787,5 \text{ kg/m} = 787,5 \text{ kg/m}$$

- Beban garis “P”**

$P = 12 \text{ ton}$

Untuk perhitungan momen dan gaya lintang :

$$\text{Beban garis (P')} = \frac{P}{2,75} \times \alpha \times s' \times K, \text{ dimana :}$$

K = koefisien kejut, yang ditentukan dengan rumus :

$$K = 1 + \left(\frac{20}{(50 + 80)} \right) = 1 + \left(\frac{20}{(50 + 80)} \right) = 1,153$$

$$\begin{aligned}
 P' &= \frac{P}{2,75} \times \alpha \times s' \times K = \frac{12}{2,75} \times 0,75 \times 1,75 \times 1,153 \\
 &= 6,604 \text{ T} = 6604 \text{ kg}
 \end{aligned}$$

Ketentuan penggunaan beban “D” dalam arah melintang jembatan :

Untuk jembatan dengan lebar lantai kendaraan lebih besar dari 5,50 meter, beban “D” sepenuhnya (100%) dibebankan pada lebar jalur 5,50 meter sedang lebar selebihnya dibebani hanya separuh beban “D” (50%).

$$P' = 100 \% \times 6604 = 6604 \text{ kg}$$

Gaya geser maksimum akibat beban hidup (Dmax LL) :

$$\begin{aligned}
 D_{makLL} &= \frac{1}{2} p' + \frac{1}{2} q' L \\
 &= (\frac{1}{2} \times 6604) + (\frac{1}{2} \times 787,5 \times 5) \\
 &= 5270,75 \text{ kg}
 \end{aligned}$$

Momen maksimum akibat beban hidup (Mmax LL) :

$$\begin{aligned}
 M_{max} &= \left(\frac{1}{8} \times q' \times l^2 \right) + \left(\frac{1}{4} \times P \times l \right) \\
 &= \left(\frac{1}{8} \times 787,5 \times 5^2 \right) + \left(\frac{1}{4} \times 6604 \times 5 \right) \\
 &= 10715,938 \text{ kgm}
 \end{aligned}$$

Gaya geser total pada gelagar tengah :

$$\begin{aligned}
 D_{tot} &= D_{makDL} + D_{makLL} \\
 &= 2941,20 \text{ kg} + 5270,75 \text{ kg} \\
 &= 8211,95 \text{ kg}
 \end{aligned}$$

Momen total pada gelagar tengah :

$$\begin{aligned} M_{tot} &= M_{max DL} + M_{max LL} \\ &= 3676,50 + 10715,938 \\ &= 14392,437 \text{ kgm} \end{aligned}$$

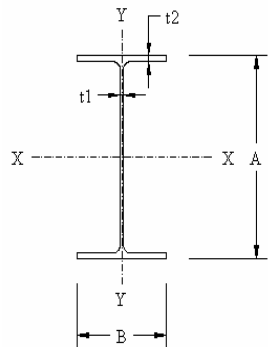

2) Pendimensionian Profil gelagar tengah

$$M_{tot} = 14392,437 \text{ kgm} = 1439243,7 \text{ kgcm}$$

$$\bar{\sigma}_{Bj 44} = 1867 \text{ kg/cm}^2$$

$$W_x = \frac{M_{tot}}{\bar{\sigma}} = \frac{1439243,7}{1867} = 770,885 \text{ cm}^3$$

Digunakan profil baja IWF 350 × 175 x 7 x 11 – 49,6

	Profil WF	Berat (kg/m)	Ukuran (mm)				
			A	B	t1	t2	r
	350 x 175	49,6	350	175	7	11	14

Luas tampang	Momen Inersia		Jari-jari Inersia		Momen Lawan	
	Ix	Iy	ix	iy	Wx	Wy
63,14	13600	984	14,7	3,95	775	112

3) Kontrol terhadap bahan dan tegangan

- Kontrol terhadap lendutan (δ)

$$\begin{aligned} \delta_{\max} &= \frac{5 \times q_{tot} \times L^4}{384 EI_x} + \frac{P \times L^3}{48 EI_x} < \delta_{ijin} \\ &= \frac{5 \times (11,764 + 7,875) \times 500^4}{384 \times (2,1 \times 10^6) \times 13600} + \frac{6604 \times 500^3}{48 \times (2,1 \times 10^6) \times 13600} < \frac{L}{500} \\ &= 0,559 + 0,409 < 1,00 \text{ cm} \\ &= 0,968 \text{ cm} < 1,00 \text{ cm} \dots \dots \dots \text{OK} \end{aligned}$$

- Kontrol terhadap tegangan lentur yang terjadi (σ) :

$$\begin{aligned}
 \sigma_{terjadi} &= \frac{M_{tot}}{W_x} < \bar{\sigma} \\
 &= \frac{1439243,7}{775} < 1867 \text{ kg/cm} \\
 &= 1857,088 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots\dots\dots \text{OK}
 \end{aligned}$$

- Kontrol terhadap tegangan geser yang terjadi (τ)

$$\begin{aligned}
 D_{\max} &= \left(\frac{1}{2} \times q_{tot} \times L \right) + \left(\frac{1}{2} \times P \right) \\
 &= \left(\frac{1}{2} \times (11,764 + 7,875) \times 500 \right) + \left(\frac{1}{2} \times 6604 \right) \\
 &= 8211,75 \text{ kg}
 \end{aligned}$$

$$\begin{aligned}
 A_{web} &= A_{profil} - A_{flens} \\
 &= 72,16 - (2 \times (19,9 \times 1,1)) \\
 &= 28,38 \text{ cm}^2
 \end{aligned}$$

$$\begin{aligned}
 \tau_{terjadi} &= \frac{D_{\max}}{A_{web}} < \bar{\tau} \\
 &= \frac{8211,75}{28,38} < 0,58 \times \bar{\sigma} \\
 &= 289,349 \text{ kg/cm}^2 < 1082,86 \text{ kg/cm}^2 \dots\dots\dots \text{OK}
 \end{aligned}$$

5.2.5 Perencanaan Gelagar Melintang

Pembebanan pada gelagar melintang meliputi :

a. Beban Mati

Terdiri dari berat sendiri gelagar dan beban yang bekerja di atasnya (gelagar memanjang, pelat lantai jembatan, perkerasan, dan air hujan).

b. Beban Hidup

Beban hidup pada gelagar jembatan dinyatakan dengan beban “D” atau beban jalur, yang terdiri dari beban terbagi rata “q” ton per meter panjang per jalur lalu lintas tersebut.

Pada jembatan rangka baja, elemen struktur komposit terbentuk melalui kerjasama antara gelagar melintang dengan pelat beton. Factor penting dalam struktur komposit adalah lekatan antara gelagar melintang dengan pelat beton harus tetap ada. Untuk menjaga agar lekatan ini tetap ada, perlu adanya penghubung geser (shear conector) yang berfungsi untuk menahan gaya geser yang terjadi pada bidang pertemuan antara pelat beton dengan gelagar melintang. Pemakaian dek baja dibawah pelat beton berfungsi sebagai cetakan tetap dan untuk menahan momen positif yang terjadi pada pelat beton. Pemasangan dek baja sejajar dengan gelagar melintang.

5.2.5.1 Kondisi Pre Komposit

Kondisi pre komposit adalah kondisi dimana pelat beton belum mengeras dan beban hidup belum bekerja

1. Perhitungan Momen Lentur Gelagar Melintang

Gambar 5.12 Beban Mati Pada Kondisi Pre Komposit

Beban P1

Berat trotoar	$= 0,25 \times 1,00 \times 2500$	$= 625$	kg/m
Berat plat lantai	$= 0,20 \times 1,00 \times 2500$	$= 500$	kg/m
Berat air hujan	$= 0,05 \times 1,00 \times 1000$	$= 50$	kg/m
Berat dek baja	$= 1,00 \times 11,35$	$= 11,35$	kg/m +
		$= 1311,35$	kg/m

Beban mati tersebut merupakan gaya terpusat (P1) yang bekerja pada titik tumpu gelagar melintang :

$$\begin{aligned} P1 &= q1 \times L \\ &= 1311,35 \times 5,00 = 6556,75 \text{ kg} \end{aligned}$$

Beban P2

Berat plat lantai kendaraan	$= 0,20 \times 0,875 \times 2500$	$= 437,5$	kg/m
Berat air hujan	$= 0,05 \times 0,875 \times 1000$	$= 43,75$	kg/m

$$\begin{aligned}\text{Berat dek baja} &= 0,875 \times 11,35 &= 9,93 \text{ kg/m} + \\ & &= 491,18 \text{ kg/m}\end{aligned}$$

Beban Trapezium diubah menjadi beban Ekvivalen :

$$\frac{qDL}{24} \times (3L^2 - 4a^2) = \frac{qE}{8} \times L^2$$

$$\frac{491,18}{24} \times (3 \times 5^2 - 4 \times 0,875^2) = \frac{qE}{8} \times 5^2$$

$$qE = 471,123 \text{ kg/m}$$

Beban mati tersebut merupakan gaya terpusat (P2) yang bekerja pada titik tumpu gelagar melintang :

$$\begin{aligned}P2 &= qE \times L \\ &= 471,123 \times 5,00 = 2355,620 \text{ kg}\end{aligned}$$

Beban P3

Berat gelagar memanjang IWF 350 x 175 x 7 x 11 – 49,6 = 49,6 kg/m

$$P3 = 49,6 \times 5,00 = 248 \text{ kg}$$

Beban P4

$$\text{Berat plat lantai kendaraan} = 0,20 \times 0,875 \times 2500 = 437,5 \text{ kg/m}$$

$$\text{Berat air hujan} = 0,05 \times 0,875 \times 1000 = 43,75 \text{ kg/m}$$

$$\begin{aligned}\text{Berat dek baja} &= 0,875 \times 11,35 &= 9,93 \text{ kg/m} + \\ & &= 491,18 \text{ kg/m}\end{aligned}$$

Beban Trapezium diubah menjadi beban Ekuivalen :

$$\frac{qDL}{24} \times (3L^2 - 4a^2) = \frac{qE}{8} \times L^2$$

$$\frac{491,18}{24} \times (3 \times 5^2 - 4 \times 0,875^2) = \frac{qE}{8} \times 5^2$$

$$qE = 471,123 \text{ kg/m}$$

Beban mati tersebut merupakan gaya terpusat (P4) yang bekerja pada titik tumpu gelagar melintang :

$$\begin{aligned}P4 &= (2 \times qE \times L) + (\text{berat gelagar memanjang} \times 5) \\ &= (2 \times 471,123 \times 5,00) + (49,6 \times 5) \\ &= 4994,23 \text{ kg}\end{aligned}$$

Beban q4

$$\text{Berat plat lantai kendaraan} = 0,20 \times 0,875 \times 2500 = 437,5 \text{ kg/m}$$

$$\text{Berat air hujan} = 0,05 \times 0,875 \times 1000 = 43,75 \text{ kg/m}$$

$$\begin{aligned} \text{Berat dek baja} &= 0,875 \times 11,35 &= 9,93 \text{ kg/m} + \\ & &= 491,18 \text{ kg/m} \end{aligned}$$

Beban segitiga diubah menjadi beban merata ekuivalen :

$$\begin{aligned} \frac{qE}{12} \times L^2 &= \frac{qE}{8} \times L^2 \\ \frac{491,18}{12} \times 1,75^2 &= \frac{491,18}{8} \times 1,75^2 \\ qE &= 327,453 \text{ kg/m} \end{aligned}$$

$$\text{beban merata ekuivalen yang bekerja} = 2 \times qE = 654,906 \text{ kg/m}$$

Reaksi Perletakan :

$$R_A = R_B = \frac{(3 \times P4) + (2 \times (P1 + P2 + P3)) + (qE \times L)}{2}$$

$$= \frac{(3 \times 4994,23) + (2 \times 9160,37) + (654,906 \times 5))}{2}$$

$$= 18288,98 \text{ kg}$$

Momen maksimum akibat beban mati :

$$= (R_{AV} \times 4,5) - ((P_1 + P_2 + P_3) \times 3,5) - (P_4 \times 1,75) - (qE \times 3,5 \times 1,75)$$

$$= (18288,98 \times 4,5) - (9160,37 \times 3,5) - (4994,23 \times 1,75) - (654,906 \times 3,5 \times 1,75)$$

$$= 37487,913 \text{ kgm}$$

Berat sendiri gelagar melintang = 215 kg/m

Asumsi gelagar melintang memakai profil IWF 708x302x15x28-215

$$R_p = \frac{1}{2} \times q \times L$$

$$= \frac{1}{2} \times 215 \times 9$$

$$= 967,5 \text{ kg}$$

$$M_p = \frac{1}{8} \times q \times L^2$$

$$= \frac{1}{8} \times 215 \times 9^2$$

$$= 2176,875 \text{ kgm}$$

Perhitungan geser dan momen yang bekerja pada kondisi Pra-Komposit :

$$D_{PRA} = 18288,98 + 967,5$$

$$= 19256,48 \text{ kg}$$

$$M_{PRA} = 37487,913 + 2176,875$$

$$= 39664,788 \text{ kgm}$$

2. Pendimensian Gelagar Melintang

$$M_{PRA} = 39664,788 \text{ kgm} = 3966478,8 \text{ kgcm}$$

$$\bar{\sigma}_{Bj 44} = 1867 \text{ kg/cm}^2$$

$$W_x = \frac{M_{tot}}{\bar{\sigma}} = \frac{3966478,8}{1867} = 2124,519 \text{ cm}^3$$

Digunakan profil baja IWF 708x302x15x28-215

Profil WF	Berat (kg/m)	Ukuran (mm)				
		A	B	t1	t2	r
708 x 302	215	708	302	15	28	28

Luas tampang	Momen Inersia		Jari-jari Inersia		Momen Lawan	
	Ix	Iy	ix	iy	Wx	Wy
273,6	237000	12900	29,4	6,86	6700	853

3. Kontrol Terhadap Bahan Dan Tegangan

- o Kontrol terhadap lendutan (δ)

$$q = \frac{(215 \times 9) + (654,906 \times 7)}{9} = 724,371 \text{ kg/m} = 7,243 \text{ kg/cm}$$

- o Akibat beban terpusat di tepi

$$P1 = 9160,37 \text{ kg dan } P2 = 4994,23 \text{ kg}$$

$$\delta_1 = \frac{P1 \times a1}{24 EI} (3 L^2 - 4 a1^2) + \frac{P1 \times a2}{24 EI} (3 L^2 - 4 a2^2) =$$

$$\frac{9160,37 \times 100 (3 \times 900^2 - 4 \times 100^2)}{24 \times 2,1 \times 10^6 \times 237000} + \frac{4994,23 \times 275 (3 \times 900^2 - 4 \times 275^2)}{24 \times 2,1 \times 10^6 \times 237000}$$

$$= 0,183 + 0,244 = 0,427 \text{ cm}$$

- Akibat beban terpusat di tengah

$$P2 = 4994,23 \text{ kg}$$

$$\delta_2 = \frac{P2 \times L^3}{48 EI}$$

$$= \frac{4994,23 \times 900^3}{48 \times 2,1 \times 10^6 \times 237000} = 0,152 \text{ cm}$$

- Akibat berat sendiri gelagar melintang

Gelagar melintang adalah IWF 594x302x14x23-175 dengan berat 175 kg/m

$$\delta_3 = \frac{5 \times q \times L^4}{384 EI}$$

$$= \frac{5 \times 1,75 \times 900^4}{384 \times 2,1 \times 10^6 \times 237000} = 0,052 \text{ cm}$$

Lendutan total pada kondisi pra komposit adalah :

$$\delta_{\text{total}} = \delta_1 + \delta_2 + \delta_3$$

$$= 0,427 + 0,152 + 0,052$$

$$= 0,631 \text{ cm}$$

Lendutan Ijin (δ_{ijin})

$$\delta_{ijin} = \frac{L}{500} = \frac{900}{500} = 1,800 \text{ cm}$$

$$\delta_{PRA-KOMP} = 0,631 < \delta_{ijin} = 1,800 \text{ cm} \dots\dots\text{OK}$$

- Kontrol terhadap tegangan lentur yang terjadi (σ) :

$$\begin{aligned}\sigma_{terjadi} &= \frac{M_{tot}}{W_x} < \bar{\sigma} \\ &= \frac{3966478,8}{6700} < 1867 \text{ kg/cm} \\ &= 592,011 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots\dots\text{OK}\end{aligned}$$

- Kontrol terhadap tegangan geser yang terjadi (τ) :

$$\begin{aligned}S_x &= (30,2 \times 2,8 \times 34) + (1,5 \times 26,9 \times 16,3) \\ &= 3532,745 \text{ cm}^3\end{aligned}$$

$$\begin{aligned}\tau_{terjadi} &= \frac{D_{pra} \times S_x}{b \times I_x} < \tau \\ &= \frac{19256,48 \times 3532,745}{1,5 \times 237000} < 0,58 \times \sigma \\ &= 191,359 < 1082,86 \text{ kg/cm}^2 \dots\dots\text{OK}\end{aligned}$$

- Kontrol terhadap tegangan idiil ditengah bentang (τ_i) :

$$\begin{aligned} P &= P_3 + (q_E \times 7) + (q_D \times 9) \\ &= 4994,23 + (654,906 \times 7) + (215 \times 9) \\ &= 11513,572 \text{ kg} \end{aligned}$$

$$M_{\text{pra}} = 39664,788 \text{ kgm} = 3966478,8 \text{ kgcm}$$

$$\begin{aligned} \tau_{\text{terjadi}} &= \frac{P \times S}{b \times I_x} \\ &= \frac{11513,572 \times 3532,745}{1,5 \times 237000} \\ &= 114,149 \text{ kg/cm}^2 \end{aligned}$$

$$\begin{aligned} \sigma_{\text{terjadi}} &= \frac{M}{W_x} \\ &= \frac{3966478,8}{6700} \\ &= 592,011 \text{ kg/cm}^2 \end{aligned}$$

$$\begin{aligned} \tau_i &= \sqrt{\sigma^2 + (3 \times \tau^2)} &< \sigma \\ &= \sqrt{592,011^2 + (3 \times 114,149^2)} &< 1867 \text{ kg/cm}^2 \\ &= 624,153 \text{ kg/cm}^2 &< 1867 \text{ kg/cm}^2 \dots \dots \text{OK} \end{aligned}$$

5.2.5.2 Kondisi Post Komposit

Kondisi pre komposit adalah kondisi dimana pelat beton telah mengeras dan beban hidup telah bekerja

1. Perhitungan Momen Lentur Gelagar Melintang

Beban Mati

Gambar 5.13 Beban Mati Pada Kondisi Post Komposit

Beban P1

$$\text{Berat trotoar} = 0,25 \times 1,00 \times 2500 = 625 \text{ kg/m}$$

Beban mati tersebut merupakan gaya terpusat (P1) yang bekerja pada titik tumpu gelagar melintang :

$$\begin{aligned} P1 &= q1 \times L \\ &= 625 \times 5,00 = 3125 \text{ kg} \end{aligned}$$

Beban P2

$$\text{Berat air hujan} = 0,05 \times 0,875 \times 1000 = 43,75 \text{ kg/m}$$

$$\begin{aligned} \text{Berat lapis perkerasan} &= 0,05 \times 0,875 \times 2200 = 96,25 \text{ kg/m} + \\ &= 140 \text{ kg/m} \end{aligned}$$

Beban Trapezium diubah menjadi beban Ekvivalen :

$$\frac{qDL}{24} \times (3L^2 - 4a^2) = \frac{qE}{8} \times L^2$$

$$\frac{140}{24} \times (3 \times 5^2 - 4 \times 0,875^2) = \frac{qE}{8} \times 5^2$$

$$qE = 134,283 \text{ kg/m}$$

Beban mati tersebut merupakan gaya terpusat (P2) yang bekerja pada titik tumpu gelagar melintang :

$$P2 = qE \times L$$

$$= 134,283 \times 5,00 = 671,415 \text{ kg}$$

Beban P3

$$\text{Berat air hujan} = 0,05 \times 0,875 \times 1000 = 43,75 \text{ kg/m}$$

$$\begin{aligned} \text{Berat lapis perkerasan} &= 0,05 \times 0,875 \times 2200 = 96,25 \text{ kg/m} + \\ &= 140 \text{ kg/m} \end{aligned}$$

Beban Trapezium diubah menjadi beban Ekvivalen :

$$\frac{qDL}{24} \times (3L^2 - 4a^2) = \frac{qE}{8} \times L^2$$

$$\frac{140}{24} \times (3 \times 5^2 - 4 \times 0,875^2) = \frac{qE}{8} \times 5^2$$

$$qE = 134,283 \text{ kg/m}$$

Beban mati tersebut merupakan gaya terpusat (P4) yang bekerja pada titik tumpu gelagar melintang :

$$\begin{aligned} P3 &= (2 \times qE \times L) \\ &= (2 \times 134,283 \times 5,00) \\ &= 1342,83 \text{ kg} \end{aligned}$$

Beban q4

$$\text{Berat air hujan} = 0,05 \times 0,875 \times 1000 = 43,75 \text{ kg/m}$$

$$\begin{aligned} \text{Berat lapis perkerasan} &= 0,05 \times 0,875 \times 2200 = 96,25 \text{ kg/m} + \\ &= 140 \text{ kg/m} \end{aligned}$$

Beban segitiga diubah menjadi beban merata ekivalen :

$$\frac{qE}{12} \times L^2 = \frac{qE}{8} \times L^2$$

$$\frac{491,18}{12} \times 1,75^2 = \frac{qE}{8} \times 1,75^2$$

$$qE = 93,333 \text{ kg/m}$$

beban merata ekivalen yang bekerja = $2 \times qE = 186,666 \text{ kg/m}$

Reaksi Perletakan :

$$R_A = R_B = \frac{(3 \times P3) + (2 \times ((P1 + P2))) + (qE \times L))}{2}$$

$$= \frac{(3 \times 1342,83) + (2 \times 3796,415) + (186,666 \times 5))}{2}$$

$$= 6277,31 \text{ kg (D1)}$$

Momen maksimum akibat beban mati :

$$= (R_{AV} \times 4,5) - ((P1 + P2) \times 3,5) - (P3 \times 1,75) - (qE \times 3,5 \times 1,75)$$

$$\begin{aligned}
 &= (6277,31 \times 4,5) - (3796,415 \times 3,5) - (1342,83 \times 1,75) - (186,666 \times 3,5 \times 1,75) \\
 &= 11468,613 \text{ kgm } (\mathbf{M1})
 \end{aligned}$$

b. Beban Hidup

- Beban terbagi rata (“q”)

Bentang jembatan = 80 m, maka :

$$q = 1.1 (1 + 30/L) \text{ t/m' } \quad \text{untuk } L > 60 \text{ m}$$

$$= 1.1 (1 + 30/80) \text{ t/m'}$$

$$= 1,65 \text{ t/m}$$

- Beban terbagi rata sepanjang gelagar melintang untuk lebar 5,5 m

$$q_1 = \frac{q \times 5,5}{2,75} = \frac{1,65 \times 5,5}{2,75} = 3 \text{ t/m} = 3000 \text{ kg/m}$$

- Beban terbagi rata untuk lebar sisanya

$$q_2 = 50 \% \times 3000 \text{ kg/m} = 1500 \text{ kg/m}$$

- Beban terbagi rata pada trotoar

$$q_3 = 60\% \times (500 \times 500) = 1,5 \text{ ton/m} = 1500 \text{ kg/m}$$

Reaksi peletakan :

$$R_A = R_B = \frac{(q_1 \times 5,5) + (2 \times q_2 \times 0,75) + (2 \times q_3 \times 1,00)}{2}$$

$$= \frac{(3000 \times 5,5) + (2 \times 1500 \times 0,75) + (2 \times 1500 \times 1,00)}{2}$$

$$= 10875 \text{ kg}$$

Momen maksimum yang terjadi akibat beban q :

$$\begin{aligned}
&= (R_A \times 4,5) - (1500 \times 1,0 \times 4,0) - (q_2 \times 0,75 \times 3,125) - (q_1 \times 2,75 \times 1,375) \\
&= (10875 \times 4,5) - (1500 \times 1,0 \times 4,0) - (1500 \times 0,75 \times 3,125) - (3000 \times 2,75 \times 1,375) \\
&= 28078,125 \text{ kgm (M2)}
\end{aligned}$$

Menentukan Geser Maksimum (Dmak) akibat beban q

Reaksi Peletakan

$$\Sigma M_A = 0$$

$$(R_B \times 9,0) - (q_3 \times 1,0 \times 8,5) - (q_2 \times 1,5 \times 7,25) - (q_1 \times 5,5 \times 3,75) - (q_3 \times 1,0 \times 0,5) = 0$$

$$(R_B \times 9,0) - (1,5 \times 1,0 \times 8,5) - (1,5 \times 1,5 \times 7,25) - (3 \times 5,5 \times 3,75) - (1,5 \times 1,0 \times 0,5) = 0$$

$$R_B = \frac{66,9375}{9} = 7,4375 \text{ t} = 7437,5 \text{ kg}$$

$$\Sigma M_B = 0$$

$$(R_A \times 9,0) - (q_3 \times 1,0 \times 8,5) - (q_1 \times 5,5 \times 5,25) - (q_2 \times 1,5 \times 1,75) - (q_3 \times 1,0 \times 0,5) = 0$$

$$(R_A \times 9,0) - (1,5 \times 1,0 \times 8,5) - (3 \times 5,5 \times 5,25) - (1,5 \times 1,5 \times 1,75) - (1,5 \times 1,0 \times 0,5) = 0$$

$$R_A = \frac{78,561}{9} = 8,729167 \text{ t} = 8729,167 \text{ kg (D2)}$$

- Beban “P”

$$P = 12 \text{ ton}$$

$$\text{Koefesien kejut (K)} = 1 + \left(\frac{20}{(50 + L)} \right)$$

$$K = 1 + \left(\frac{20}{(50 + 80)} \right) = 1,182$$

- Beban P bekerjasepanjang gelagar melintang untuk lebar 5,5 m

$$P_1 = \frac{P}{2,75} \times K = \frac{12}{2,75} \times 1,182 = 5,158 \text{ t/m} = 5158 \text{ kg/m}$$

○ Beban P untuk lebar sisanya (50% dari P1)

$$P_2 = 50 \% \times 5158 \text{ kg/m} = 2579 \text{ kg/m}$$

Reaksi Perletakan:

$$\begin{aligned} R_A &= \frac{(P_2 \times 0,75) + (P_1 \times 5,5) + (P_2 \times 0,75)}{2} \\ &= \frac{(2579 \times 0,75) + (5158 \times 5,5) + (2579 \times 0,75)}{2} \\ &= 16118,75 \text{ kg} \end{aligned}$$

Momen maksimum yang terjadi akibat beban garis "P"

$$\begin{aligned} M_{\max} &= (R_A \times 4,5) - (P_2 \times 0,75 \times 3,125) - (P_1 \times 2,75 \times 1,375) \\ &= (16118,75 \times 4,5) - (2579 \times 0,75 \times 3,125) - (5158 \times 2,75 \times 1,375) \\ &= 46986,156 \text{ kgm (M3)} \end{aligned}$$

Menentukan Geser Maksimum (Dmak) akibat beban P :

Reaksi Peletakan :

$$\sum M_A = 0$$

$$(R_B \times 9,0) - (P_1 \times 5,5 \times 3,75) - (P_2 \times 1,50 \times 7,25) = 0$$

$$(R_B \times 9,0) - (5158 \times 5,5 \times 3,75) - (2579 \times 1,50 \times 7,25) = 0$$

$$R_B = \frac{134430,375}{9} = 14936,708 \text{ kg}$$

$$\Sigma M_B = 0$$

$$(R_A \times 9,0) - (P_1 \times 5,5 \times 5,25) - (P_2 \times 1,50 \times 1,75) = 0$$

$$(R_A \times 9,0) - (5158 \times 5,5 \times 5,25) - (2579 \times 1,50 \times 1,75) = 0$$

$$R_A = \frac{155707,125}{9} = 17300,792 \text{ kg (D3)}$$

Perhitungan Momen dan Geser yang Bekerja

- Momen

$$\begin{aligned} M_{\text{post}} &= M_{\text{pra}} + M_1 + M_2 + M_3 \\ &= 39664,788 + 11468,613 + 28078,125 + 46986,156 \\ &= 126197,682 \text{ kgm} \end{aligned}$$

- Geser

$$\begin{aligned} D_{\text{post}} &= D_{\text{pra}} + D_1 + D_2 + D_3 \\ &= 19256,48 + 6277,31 + 8729,167 + 17300,792 \\ &= 51563,749 \text{ kg} \end{aligned}$$

2. Perhitungan Gelagar Komposit

Perhitungan lebar efektif :

$$\text{Syarat : } b_{\text{eff}} \leq \frac{1}{4} \text{ Bentang} = \frac{1}{4} \times 9,0 = 2,25 \text{ m}$$

$$b_{\text{eff}} \leq \text{Jarak antar gelagar} = 5,0 \text{ m}$$

$$b_{\text{eff}} \leq 12 \times \text{Tebal pelat} = 12 \times 0,2 = 2,4 \text{ m}$$

Diambil nilai beff yang terkecil, $b_{\text{eff}} = 2,25 \text{ m}$

Data teknis profil IWF 708 × 302 x 15 x 28 – 215

Profil WF	Berat (kg/m)	Ukuran (mm)				
		A	B	t1	t2	r
708 x 302	215	708	302	15	28	28

Luas tampang	Momen Inersia		Jari-jari Inersia		Momen Lawan	
	Ix	Iy	ix	iy	Wx	Wy
273,6	237000	12900	29,4	6,90	6700	853

Angka Ekuivalen (n) :

$$E_s = 2,1 \times 10^5 \text{ MPa}$$

$$E_c = 4700 \sqrt{f'c} = 4700 \sqrt{25} = 23500 \text{ Mpa}$$

$$n = \frac{E_s}{E_c} = \frac{2,1 \times 10^5}{23500} = 8,9 \sim 9$$

Luas baja ekuivalen ($A_{EKIVALEN}$) :

$$b' = \frac{b_{eff}}{n} = \frac{2250}{9} = 250 \text{ mm} = 25 \text{ cm}$$

$$\begin{aligned} A_{EKIVALEN} &= b' \times t \\ &= 25 \times 20 = 500 \text{ cm}^2 \end{aligned}$$

$$A_{PROFIL} = 273,6 \text{ cm}^2$$

Luas penampang komposit (A_{KOMPOSIT}) :

$$\begin{aligned} A_{\text{KOMPOSIT}} &= A_{\text{EKIVALEN}} + A_{\text{PROFIL}} \\ &= 500 + 273,6 \\ &= 773,6 \text{ cm}^2 \end{aligned}$$

Titik berat penampang komposit (Y_{komp}) :

$$\begin{aligned} y &= \frac{\left(A_1 \times \left(\frac{h}{2} \right) \right) + \left(\left(\frac{b_e}{n} \right) \times t \times \left(h + \frac{t}{2} \right) \right)}{\left(A_1 + \left(\frac{b_e}{n} \times t \right) \right)} \\ &= \frac{\left(273,6 \times \left(\frac{70,8}{2} \right) \right) + \left(\left(\frac{225}{9} \right) \times 20 \times \left(70,8 + \frac{20}{2} \right) \right)}{\left(273,6 + \left(\frac{225}{9} \times 20 \right) \right)} \\ &= 64,743 \text{ cm} \end{aligned}$$

Momen inersia penampang komposit (I_k) :

$$= \left(I_x + \left(A_1 \times \left(y - \frac{h}{2} \right)^2 \right) \right) + \left(\left(\frac{1}{12} \times \left(\frac{b_e}{n} \right) \times t^3 \right) + \left(\left(\frac{b_e}{n} \right) \times t \times \left(h + \frac{t}{2} - y \right)^2 \right) \right)$$

$$\begin{aligned}
 &= \left(237000 + \left(2736x \left(64,743 - \frac{70,8}{2} \right)^2 \right) \right) + \left(\frac{1}{12} x 25 x 20^3 \right) + \left(25x20x \left(70,8 + \frac{20}{2} - 64,743 \right)^2 \right) \\
 &= 472572,787 + 16666,667 + 128913,624 \\
 &= 618153,078 \text{ cm}^4
 \end{aligned}$$

$$Y_{ts} = Y_{bs} = \frac{708}{2} = 354 \text{ mm} = 35,4 \text{ cm}$$

$$Y_c = h_{\text{profil}} + \frac{1}{2} x h_{\text{beton}} = 708 + \frac{1}{2} x 200 = 808 \text{ mm} = 80,8 \text{ cm}$$

Balok komposit direncanakan menggunakan dek baja trapesium dengan tinggi rusuk 55 mm dan tebal 4,5 mm.

Gambar 5.14 Titik Berat Penampang Komposit

3. Perhitungan Terhadap Tegangan

○ Kontrol terhadap tegangan lentur (σ)

- Pada bagian atas pelat beton

$$\begin{aligned}\sigma_C &= \frac{M_{post} \times (h + t - y)}{n \times I_k} < \bar{\sigma}_c \\ &= \frac{12619768,2 \times (70,8 + 20 - 64,743)}{9 \times 618153,078} < 0,45 \times 250 \\ &= 59,106 \text{ kg/cm}^2 < 112,5 \text{ kg/cm}^2 \dots\dots\dots \text{OK}\end{aligned}$$

- Pada bagian bawah pelat beton

$$\begin{aligned}\sigma_C &= \frac{M_{post} \times (h - y)}{n \times I_k} < \bar{\sigma}_c \\ &= \frac{12619768,2 \times (70,8 - 64,743)}{9 \times 618153,078} < 0,45 \times 250 \\ &= 13,739 \text{ kg/cm}^2 < 112,5 \text{ kg/cm}^2\end{aligned}$$

- Pada sayap atas profil baja

$$\begin{aligned}\sigma_{BS} &= \frac{M_D \times \left(\frac{h}{2}\right)}{I_X} + \frac{M_L \times (h - y)}{I_K} < \bar{\sigma}_s \\ &= \frac{(3966478,8 + 1146861,3) \times \left(\frac{70,8}{2}\right)}{237000} + \frac{(2807812,5 + 4698615,6) \times 6,057}{618153,078} \\ &= 763,764 + 73,552 < 1867 \text{ kg/cm}^2 \\ &= 837,316 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots\dots\dots \text{OK}\end{aligned}$$

- Pada sayap bawah profil baja

$$\sigma_{BS} = \frac{M_D \times \left(\frac{h}{2}\right)}{I_X} + \frac{M_L \times y}{I_K} < \bar{\sigma}_s$$

$$\frac{(3966478,8 + 1146861,3) \times \left(\frac{70,8}{2}\right)}{137000} + \frac{(2807812,5 + 4698615,6) \times 64,743}{618153,078}$$

$$= 763,764 + 786,194 < 1867 \text{ kg/cm}^2$$

$$= 1549,958 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots\dots\dots \text{OK}$$

○ Diagram tegangan sebelum dan sesudah komposit

- Tegangan sebelum komposit (pra komposit)

Pada sayap atas profil baja = 592,011 kg/cm²

Pada sayap bawah profil baja = 592,011 kg/cm²

- Tegangan sesudah komposit (post komposit)

Pada bagian atas pelat beton = 59,016 kg/cm²

Pada bagian bawah pelat beton = 13,739 kg/cm²

Pada sayap atas profil baja = 837,316 kg/cm²

Pada sayap bawah profil baja = 1549,958 kg/cm²

Gambar 5.15 Diagram Tegangan Sebelum Dan Sesudah Komposit

- Kontrol terhadap tegangan Geser (τ)

Statis momen terhadap garis netral komposit :

- Pada Plat Beton

$$\begin{aligned}
 S_{x1} &= b' \times t \times e_k \\
 &= 250 \times 200 \times 160,57 \\
 &= 8028500 \text{ mm}^3 = 8028,5 \text{ cm}^3
 \end{aligned}$$

- Pada Profil baja

$$\begin{aligned}
 S_{x1} &= A_{\text{profil}} \times e_s \\
 &= 273,6 \times 293,43 \\
 &= 80282,448 \text{ mm}^3 = 80,282 \text{ cm}^3
 \end{aligned}$$

$$\tau_{\text{TERJADI}} = \frac{D_{\text{POST}} \times (S_{x1} + S_{x2})}{b \times I_x} < \bar{\tau}$$

$$\begin{aligned}
 \tau_{\text{TERJADI}} &= \frac{51563,749 \times (8028,5 + 80,282)}{1,5 \times 237000} < 0,58 \times \bar{\sigma} \\
 &= 1176,144 < 1082,86 \text{ kg/cm}^2 \text{OK}
 \end{aligned}$$

- Kontrol terhadap Lendutan (τ)

1. Akibat beban mati (pada kondisi pre komposit dan post komposit)

- Kondisi pre komposit

- Kondisi post komposit

$$\begin{aligned} P1 &= P_{\text{PRE KOMPOSIT}} + P_{\text{KOMPOSIT}} \\ &= 9160,37 + 3796,415 = 12956,785 \text{ kg} \end{aligned}$$

$$\begin{aligned} P2 &= P_{\text{PRE KOMPOSIT}} + P_{\text{KOMPOSIT}} \\ &= 4994,23 + 1342,83 = 6337,06 \text{ kg} \end{aligned}$$

$$\begin{aligned} qE &= qE_{\text{PRE KOMPOSIT}} + qE_{\text{KOMPOSIT}} \\ &= 654,906 + 186,666 = 841,572 \text{ kg/m} \end{aligned}$$

$$qD = 215 \text{ kg/m}$$

$$q = \frac{(841,572 \times 7) + (215 \times 9)}{9} = 869,556 \text{ kg/m}$$

$$\delta_1 = \left(\frac{5xqL^4}{384EI_x} \right) + \sum \left(\frac{Pxa}{24EI_x} x(3L^2 - 4a^2) \right) + \left(\frac{PxL^3}{48EI_x} \right)$$

$$= \left(\frac{5 \times 8,67556 \times 900^4}{384(2,1 \times 10^6) \times 237000} \right) + \sum \left(\frac{12956,785 \times 100}{24(2,1 \times 10^6) \times 237000} \times (3 \times 900^2 - 4 \times 100^2) \right) +$$

$$\left(\frac{6337,06 \times 275}{24 \times (2,1 \times 10^6) \times 237000} \times ((3 \times 900^2) - (4 \times 100^2)) \right) + \left(\frac{6337,06 \times 900^3}{48 \times (2,1 \times 10^6) \times 237000} \right)$$

$$= 0,148 + 0,259 + 0,348 + 0,193$$

$$= 0,948 \text{ cm}$$

2. Akibat beban hidup

a. Akibat beban terbagi merata (" q ")

$$q_1 = 3000 \text{ kg/m}, \quad q_2 = 1500 \text{ kg/m}, \quad q_3 = 1500 \text{ kg/m}$$

b. Akibat beban garis (" P ")

$$P_1 = 5158 \text{ kg/m}$$

$$P_2 = 2579 \text{ kg/m}$$

$$\begin{aligned} Q1 &= q1 + P1 \\ &= 3000 + 5158 = 8158 \text{ kg/m} \end{aligned}$$

$$\begin{aligned} Q2 &= q2 + P2 \\ &= 1500 + 2579 = 4079 \text{ kg/m} \end{aligned}$$

$$Q3 = q3 = 1500 \text{ kg/m}$$

$$\begin{aligned} q_{\text{EKIVALEN}} &= \frac{(Q1 \times 7) + (2 \times Q2 \times 0,75) + (2 \times Q3 \times 1)}{9} \\ &= \frac{(8158 \times 7) + (2 \times 4079 \times 0,75) + (2 \times 1500 \times 1)}{9} \\ &= 7358,278 \text{ kg/m} \end{aligned}$$

$$\begin{aligned} \delta_2 &= \frac{5 \times q_{\text{ekuivalen}} \times L^4}{384 EI_K} \\ &= \frac{5 \times 73,58278 \times 900^4}{384 \times (2,1 \times 10^6) \times 618153,078} \\ &= 0,484 \text{ cm} \end{aligned}$$

Lendutan total (δ_{total})

$$\begin{aligned} \delta_{\text{total}} &= \delta_1 + \delta_2 \\ &= 0,948 + 0,484 \\ &= 1,432 \text{ cm} \end{aligned}$$

Lendutan ijin (δ_{ijin})

$$\delta_{\text{ijin}} = \frac{L}{500} = \frac{900}{500} = 1,8 \text{ cm}$$

$$\delta_{\text{total}} = 1,432 \text{ cm} < \delta_{\text{ijin}} = 1,8 \text{ cm} \dots \dots \dots \text{OK}$$

5.2.6 Perhitungan Penghubung Geser (*Shear Connector*)

Shear Connector digunakan untuk menahan gaya geser memanjang yang terjadi pada bidang pertemuan anatar pelat beton dengan belok baja.

Syarat teknis perencanaan *shear connector* dengan menggunakan stud adalah :

- Jarak minimal antar stud arah memanjang balok $5d$ dan tidak kurang 10 cm
- Jarak maksimal antar stud tidak boleh lebih dari delapan kali tebal pelat beton, atau kurang dari 800 mm
- Jarak antar stud tegak lurus balok tidak boleh kurang dari $d + 3$ cm
- Panjang minimal stud $4d$
- Jarak minimal ujung stud dengan permukaan beton 4 cm

Perhitungan Gaya Lintang

Gambar 5.16 Pembebanan Pada Perhitungan Shear Connector

Pembebanan :

a. Beban Mati Terpusat

- P1 = beban mati terpusat yang bekerja pada titik C dan G adalah beban mati terpusat pada kondisi pre komposit dan post komposit
$$= 9160,37 \text{ kg} + 3796,415 \text{ kg}$$
$$= 12956,785 \text{ kg}$$
- P2 = beban mati terpusat yang bekerja pada titik D, E dan f adalah beban mati terpusat pada kondisi pre komposit dan post komposit

$$= 4994,23 \text{ kg} + 1342,83 \text{ kg}$$

$$= 6337,06 \text{ kg}$$

b. Beban Mati Merata

- $q_E = q_{E_{\text{PREKOMPOSIT}}} + q_{E_{\text{POST KOMPOSIT}}}$
 $= 654,906 + 186,666$
 $= 841,572 \text{ kg/m}$

c. Berat Sendiri Gelagar Melintang

- $q_D = \text{beban mati merata (berat sendiri gelagar melintang)} = 215 \text{ kg/m}$

d. Berat Hidup (beban " D ")

- $q_{L1} = \text{beban " D " untuk lebar 5,5 meter}$
 $= \text{beban terbagi rata (q)} + \text{beban gars (P)}$
 $= 3000 \text{ kg/m} + 5158 \text{ kg/m}$
 $= 8158 \text{ kg/m}$
- $q_{L2} = \text{beban " D " untuk lebar sisanya (2 x 0,75 m)}$
 $= \text{beban terbagi rata (q)} + \text{beban gars (P)}$
 $= 1500 \text{ kg/m} + 2579 \text{ kg/m}$
 $= 4079 \text{ kg/m}$

e. Berat Hidup Pada Trotoar

- $q_{L3} = \text{beban hidup pada trotoar} = 1500 \text{ kg/m}$

Reaksi Perletakan :

$$\sum M_A = 0$$

$$(R_B \times 9) - (215 \times 9 \times 4,5) - (841,572 \times 7 \times 4,5) - (1500 \times 1 \times 8,5) - (4079 \times 1,75 \times 7,125) - (8158 \times 5,25 \times 3,625) - (1500 \times 1 \times 0,5) - (12956,785 \times 8) - (6337,06 \times 6,25) - (6337,06 \times 4,5) - (6337,06 \times 2,75) - (12956,785 \times 1) = 0$$

$$(R_B \times 9) - 8626,5 - 26509,518 - 12750 - 50860,03125 - 155256,9375 - 750 - 103654,28 - 39606,625 - 28516,77 - 17426,915 - 12956,785 = 0$$

$$9 R_B = 456914,3618$$

$$R_B = 50768,26242 \text{ kg}$$

$$\sum M_B = 0$$

$$(R_A \times 9) - (215 \times 9 \times 4,5) - (841,572 \times 7 \times 4,5) - (1500 \times 1 \times 0,5) - (4079 \times 1,75 \times 1,875) - (8158 \times 5,25 \times 5,375) - (1500 \times 1 \times 8,5) - (12956,785 \times 1) - (6337,06 \times 2,75) - (6337,06 \times 4,5) - (6337,06 \times 6,25) - (12956,785 \times 8) = 0$$

$$(R_B \times 9) - 8626,5 - 26509,518 - 750 - 13384,21875 - 230208,5625 - 12750 - 12956,785 - 17426,915 - 28516,77 - 39606,625 - 103654,28 = 0$$

$$9 R_B = 494390,1743$$

$$R_B = 54932,24158 \text{ kg}$$

Gaya Lintang :

$$D_A = 54932,24158 \text{ kg}$$

$$D_{A-C} = 54932,24158 - (1500 \times 1) - (213 \times 1) = 53219,24158 \text{ kg}$$

$$D_C = 53219,24158 - 12956,785 = 40262,45658 \text{ kg}$$

$$D_{C-D} = 40262,45658 - (213 \times 1) - (841,572 \times 1,75) - (8158 \times 1,75) = 24300,20558 \text{ kg}$$

$$D_D = 24300,20558 - 6337,06 = 17963,14558 \text{ kg}$$

$$D_{D-E} = 17963,14558 - (213 \times 1) - (841,572 \times 1,75) - (8158 \times 1,75) = 2000,89458 \text{ kg}$$

Gambar 5.17 Diagram Gaya Lintang

Shear connector direncanakan menggunakan stud Ø 20 mm dengan tinggi stud (H) = 100 mm. Jumlah stud dalam arah tegak lurus sumbu gelagar melintang = 2 buah.

Kekuatan satu stud :

$$Q = 0,0005 A_s \sqrt{f'_c \times E_c}$$

$$\begin{aligned} Q &= 0,0005 x \left(\frac{1}{4} \pi D^2 \right) x \sqrt{30 x (4700 \sqrt{30})} \\ &= 0,0005 x 314 x 878,799 \\ &= 137,971 \text{ KN} \\ &= 13797,1 \text{ kg} \end{aligned}$$

$$\bar{Q} = \frac{Q}{2} = 6898,5 \text{ kg}$$

Jarak stud :

$$D = \frac{\bar{Q} \times I_k}{D \times S}$$

Dimana, \bar{Q} = Kekuatan stud dalam 1 baris (kg)

I_k = Momen inersia penampang komposit (cm^4)

D = Gaya lintang (k)

S = Statis momen bagian yang menggeser terhadap garis netral penampang komposit

$$I_k = 618153,078 \text{ cm}^4$$

$$\begin{aligned} S &= 250 \times 200 \times 160,57 \\ &= 8028500 \text{ mm}^3 \\ &= 8028,5 \text{ cm}^3 \end{aligned}$$

$$d1 = \frac{(2 \times 6898,5) \times 618153,078}{54932,24158 \times 8028,5} = 19,338 \text{ cm} \sim 20 \text{ cm}$$

$$d2 = \frac{(2 \times 6898,5) \times 618153,078}{40262,45658 \times 8028,5} = 24,384 \text{ cm} \sim 25 \text{ cm}$$

$$d3 = \frac{(2 \times 6898,5) \times 618153,078}{17963,14558 \times 8028,5} = 59,137 \text{ cm} \sim 60 \text{ cm}$$

Sambungan antara stud dan gelagar melintang menggunakan sambungan las sudut.

Perhitungan Las Sudut :

$$a. \text{ Tebal Las } = a \leq \frac{1}{2} t \sqrt{2}$$

$$a \leq \frac{1}{2} \times 2,3 \times \sqrt{2}$$

$$a \approx 1,626 \text{ cm}$$

$$\begin{aligned} b. \text{ Luas Bidang Las} &= 0,25 \times \pi \times d^2 \\ &= 0,25 \times \pi \times (3,252 - 2)^2 \\ &= 1,230 \text{ cm}^2 \end{aligned}$$

$$\begin{aligned} c. \text{ Kekuatan Las} &= F \times \bar{\sigma} \\ &= 1,230 \times 6350 \\ &= 7810,5 \text{ kg} \end{aligned}$$

$$\text{Kekuatan satu stud} = 6898,5 \text{ kg} < 7810,5 \text{ kg}$$

Gambar 5.18 Pemasangan Shear Connector

5.2.7 Perhitungan Sambungan Gelagar Melintang dan Gelagar Memanjang

Besarnya D_{\max} gelagar memanjang (P) = 8211,75 kg

Untuk penyambungan antara gelagar melintang dan memanjang digunakan pelat penyambung profil L 130.130.14

Sambungan direncanakan menggunakan baut ϕ 2,54 cm

- Jarak antar baut :

$$3d \leq a \leq 6d$$

$$60 \leq a \leq 120$$

a diambil 70 mm

- Jarak baut ke tepi sambungan :

$$c \geq 2d$$

$$c \geq 40$$

s_1 diambil 40 mm

Gambar 5.19 Sambungan Gelagar Memanjang Dengan Protol Siku

Perhitungan gaya yang bekerja pada sambungan :

Pengaruh Desak

$$\frac{\delta}{d} = \frac{0,7}{2,54} = 0,275 < 0,628 \text{ (pengaruh desak)}$$

$$n_{ds} = \frac{P}{2 \times \sigma \times \delta \times d} = \frac{8211,75}{2 \times 1867 \times 0,7 \times 2,54} = 1,236 \sim \text{diambil 4 baut}$$

$$\text{Eksentrisitas (e)} = \frac{15}{2} + 65 = 72,5 \text{ mm}$$

Momen Luar (M_{LUAR}) :

$$\begin{aligned} M_{\text{LUAR}} &= P \times e \\ &= 8211,75 \times 7,25 \\ &= 55429,312 \text{ kgcm} \end{aligned}$$

Momen Dalam (M_{DALAM}) :

$$\begin{aligned} M_{\text{DALAM}} &= [(Ph \times y_2) + (Ph_1 \times y_1)] \times 2 \\ &= \left[(Ph \times y_2) + \left(Ph \times \frac{y_1^2}{y_2^2} \right) \right] \times 2 = \frac{2 \times Ph}{y_2} (y_2^2 + y_1^2) \end{aligned}$$

Substitusi :

$$\frac{2 \times Ph}{y_2} (y_2^2 + y_1^2) = P \times e$$

$$Ph = \frac{P \times e \times y_2}{2 \times (y_2^2 + y_1^2)}$$

$$Ph = \frac{55429,312 \times 9}{2 \times (7^2 + 3,5^2)} = 3167,389 \text{ kg}$$

$$P_v = \frac{P}{n_{\text{baut}}} = \frac{8211,75}{4} = 2052,937 \text{ kg}$$

$$\begin{aligned} R &= \sqrt{P_v^2 + Ph^2} \\ &= \sqrt{2052,937^2 + 3167,389^2} \\ &= 3774,507 \text{ kg} \end{aligned}$$

Tegangan yang terjadi pada baut luar :

$$\begin{aligned} \sigma_{ds} &= \frac{R}{\delta \times d} = \frac{3774,507}{0,7 \times 2} < 1,5 \times \bar{\sigma} \\ &= 2696,076 \text{ kg/cm}^2 < 2800,5 \text{ kg/cm}^2 \end{aligned}$$

5.2.8 Perhitungan Sambungan Gelagar Melintang dan Profil Siku

Besarnya D_{\max} gelagar memanjang (P) = 8211,75 kg

Untuk penyambungan antara gelagar melintang dan memanjang digunakan pelat penyambung profil L 130.130.14

Sambungan direncanakan menggunakan baut ϕ 2,54 cm

- Jarak antar baut :

$$3d \leq a \leq 6d$$

$$60 \leq a \leq 120,$$

a diambil 70 mm

- Jarak baut ke tepi sambungan :

$$c \geq 2d$$

$$c \geq 40$$

s_1 diambil 40 mm

Gambar 5.20 Sambungan Gelagar Memanjang Dan Gelagar Melintang

Perhitungan gaya yang bekerja pada sambungan :

Pengaruh Desak

$$\frac{\delta}{d} = \frac{1,5}{2,54} = 0,590 < 0,628 \text{ (pengaruh desak)}$$

$$n_{ds} = \frac{P}{2 \times \bar{\sigma} \times \delta \times d} = \frac{8211,75}{2 \times 1867 \times 1,5 \times 2,54} = 0,58 \sim \text{diambil 4 baut}$$

Tegangan yang terjadi pada baut :

$$\begin{aligned} \sigma_{BAUT} &= \frac{P}{2 \times n_{BAUT} \times \left(\frac{1}{4} \times \pi \times d^2 \right)} < 0,6 \times \bar{\sigma} \\ &= \frac{8211,75}{2 \times 4 \times \left(\frac{1}{4} \times 3,14 \times 2,54^2 \right)} < 1120,2 \text{ kg/cm}^2 \\ &= 202,679 \text{ kg/cm}^2 < 1120,2 \text{ kg/cm}^2 \end{aligned}$$

5.2.9 Perhitungan Pertambahan Angin

Gambar 5.21 Bidang Rangka yang Terkena Angin

Data teknis perencanaan pertambahan angin :

Tekanan angin : 150 kg/m^2

Panjang sisi bawah jembatan : 80 m

Panjang sisi atas jembatan : 75 m

Tinggi jembatan : 6,3 m

Luas bidang rangka utama : $\left(\frac{80 + 75}{2} \right) \times 6,3 = 488,25 \text{ m}^2$

5.2.9.1 Pembebanan Ikatan Angin

Gambar 5.22 Penyebaran Beban Angin

Bagian jembatan yang langsung terkena angin (angin Tekan) :

- Beban angin pada sisi rangka jembatan (d1) :

$$\begin{aligned} d1 &= 50\% \times ((30\% \times A)) \times w \\ &= 50\% \times ((30\% \times 488,25)) \times 150 \\ &= 10985,625 \text{ kg} \end{aligned}$$

- Beban angin pada muatan hidup setinggi 2 m (d2) :

$$\begin{aligned} d2 &= 100\% \times w \times L \times 2 \\ &= 100\% \times 150 \times 80 \times 2 \\ &= 24000 \text{ kg} \end{aligned}$$

Penentuan titik tangkap gaya akibat beban angin (s) :

- Beban angin pada sisi rangka jembatan (s1)

$$\begin{aligned} s1 &= \frac{1}{2} \times \text{tinggi jembatan} \\ &= \frac{1}{2} \times 6,30 \text{ m} \\ &= 3,15 \text{ m} \end{aligned}$$

- Beban angin pada muatan hidup setinggi 2 m (s2)

Tinggi profil gelagar melintang (h1) : 70,8 cm (708x302x15x28-215)

Tebal sayap gelagar melintang (h2) : 2,8 cm

Lebar profil rangka induk (h3) : 40,3 cm (406x403x16x24-200)

Tebal plat lantai kendaraan (h4) : 20 cm

Tebal perkerasan (h5) : 5 cm

Tinggi bidang vertikal beban hidup (h6): 200 cm

$$\begin{aligned} s2 &= \left(h1 - h2 - \frac{h3}{2} \right) + h4 + h5 + \frac{h6}{2} \\ &= (70,8 - 2,3 - 20,15) + 20 + 5 + 100 \\ &= 173,35 \text{ cm} = 1,733 \text{ m} \end{aligned}$$

Gambar 5.23 Titik Tangkap Gaya Angin Tekan

$$\begin{aligned}
 \Sigma M_B &= 0 \\
 (R_A \times 6,30) - (d1 \times s1) - (d2 \times s2) &= 0 \\
 (R_A \times 6,30) - (10985,625 \times 3,15) - (24000 \times 1,733) &= 0 \\
 R_A &= \frac{76196,718}{6,3} = 12094,717 \text{ kg} \\
 \Sigma M_A &= 0 \\
 (R_B \times 6,3) - (d1 \times s1) - (d2 \times (6,3 - s2)) &= 0 \\
 (R_B \times 6,3) - (10985,625 \times 3,15) - (24000 \times 4,567) &= 0 \\
 R_B &= \frac{144044,718}{6,3} = 22864,241 \text{ kg}
 \end{aligned}$$

Distribusi beban angin :

- Pada pertambahan angin atas

$$P1 = \frac{R_{A1}}{15} = \frac{12094,717}{15} = 806,314 \text{ kg}$$

- Pada pertambahan angin bawah

$$P_1 = \frac{R_B}{16} = \frac{22864,241}{16} = 1429,015 \text{ kg}$$

Bagian jembatan yang tidak langsung terkena angin (angin hisap) :

- Beban angin pada sisi rangka jembatan (d1) :

$$\begin{aligned} d1 &= 50\% \times ((15\% \times A)) \times w \\ &= 50\% \times ((15\% \times 488,25)) \times 150 \\ &= 5492,812 \text{ kg} \end{aligned}$$

Penentuan titik tangkap gaya akibat beban angin (s) :

- Beban angin pada sisi rangka jembatan (s1)

$$\begin{aligned} s1 &= \frac{1}{2} \times \text{tinggi jembatan} \\ &= \frac{1}{2} \times 6,30 \text{ m} \\ &= 3,150 \text{ m} \end{aligned}$$

Gambar 5.24 Titik Tangkap Gaya Angin Hisap

$$R_A = R_B = \frac{5492,812}{6,30} = 871,875 \text{ kg}$$

Distribusi beban angin :

- Pada pertambahan angin atas

$$P2 = \frac{R_{A1}}{15} = \frac{871,875}{15} = 58,125 \text{ kg}$$

- Pada pertambahan angin bawah

$$P2 = \frac{R_B}{16} = \frac{871,875}{16} = 54,492 \text{ kg}$$

5.2.9.2 Pertambahan Angin Atas

Gambar 5.25 Penyebaran Beban Angin Pada Ikatan Angin Atas

Gambar 5.26 Penomoran Pada Ikatan Angin Atas

Pendimensian batang 16,33,34,35,36,37,38,39,40,41,42,43,44,45,46,47,dan 32 direncanakan menggunakan profil IWF 250x175x7x11-44,1, sedangkan Batang 17,18,19,20,21,22,23,24,25,26,27,28,29,30,dan 31 direncanakan menggunakan batang L.50.50.5

Pendimensian Batang Ikatan Angin Atas

Profil IWF 250x175x7x11-44,1

Profil WF	Berat (kg/m)	Ukuran (mm)				
		A	B	t1	t2	r
250 x 175	44,1	244	175	7	11	16

Luas tampang	Momen Inersia		Jari-jari Inersia		Momen Lawan	
	Ix	Iy	ix	iy	Wx	Wy
56,24	6,120	984	10,4	4,18	502	113

Profil L 80.80.8

Profil L	Ukuran (mm)				F (cm ²)	Berat (kg/m)	Jarak titik berat (cm)		
	b	d	r	rl			e	w	v
80 x 80 8	80	85	10	5	12,3	9,66	2,26	5,66	3,20

Ix = Iy (cm ⁴)	Wx = Wy (cm ³)	ix = iy (cm)	kx = ky	Iξ (cm ⁴)	iξ (cm)	kξ	Iη (cm ⁴)	Wη (cm ³)	iη (cm)	kη
72,3	12,6	2,42	2,09	115	3,06	1,32	29,6	9,25	1,55	5,11

Dari hasil perhitungan program SAP 2000 versi 7.42, diperoleh gaya batang terbesar, dengan resiko tekuk adalah :

Batang	Gaya Batang (P) kg	Panjang (L) m	Keterangan
17 & 47	-3899,840	10,649	tekan
31 & 33	2956,51	10,649	tekan

Batang tekan

Profil IWF 250x175x7x11-44,1

S = -3899,840 kg (batang 17 & 47)

Lk = $\sqrt{9,403^2 + 5^2} = 10,649$ m

Rumus umum menurut PPBBI hal 9 Bab 4.1 Pasal 1 dan 2, untuk stabilitas batang tekan terhadap bahaya tekuk :

$$\frac{(S \times \omega)}{F} < \sigma \text{ ijin baja}$$

Dimana :

S = gaya tekan pada batang tersebut

F = luas penampang batang

ω = faktor tekuk yang tergantung dari kelangsingan dan macam bajanya

Menghitung kelangsingan batang tunggal :

$$\lambda = \frac{Lk}{I_{\min}} = \frac{1064,9}{4,18} = 254,760 \text{ cm}$$

$$\lambda_g = \pi \times \sqrt{\frac{E}{0,7 \times \sigma_1}} = 3,14 \times \sqrt{\frac{2,1 \times 10^5}{0,7 \times 240}} = 111,016$$

$$\lambda_s = \frac{\lambda}{\lambda_g} = \frac{254,760}{111,016} = 2,294$$

Untuk $\lambda_s \geq 1$:

$$\begin{aligned} \omega &= 2,381 \times \lambda_s^2 \\ &= 2,381 \times (2,294)^2 \\ &= 12,529 \end{aligned}$$

Maka :

$$\frac{(S \times \omega)}{F} = \frac{-3899,84 \times 12,529}{56,24} = 868,796 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots \text{OK}$$

Batang tarik

Profil L 80.80.8

$$S = 2956,51 \text{ kg (batang 8 \& 9)}$$

$$F_{nt} = 0,85 \times F \text{ profil}$$

$$= 0,85 \times 12,3$$

$$= 10,455 \text{ cm}^2$$

Cek Tegangan :

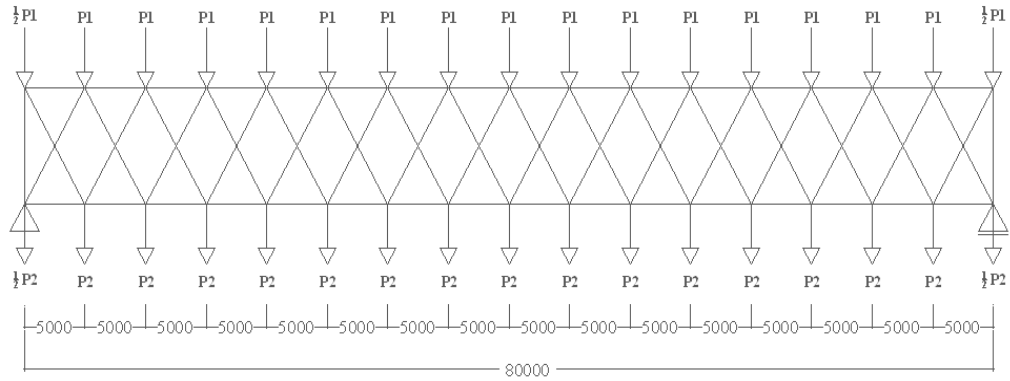

$$\sigma = \frac{S}{F_{nt}} < 1867 \text{ kg/cm}^2$$

$$= \frac{2956,51}{10,455} < 1867 \text{ kg/cm}^2$$

$$= 282,784 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots \text{OK}$$

5.2.9.3 Pertambahan Angin Bawah

Untuk pertambahan angin bawah digunakan profil L 200x200x16-48,5

Gambar 5.27 Penyebaran Beban Angin Pada Ikatan Angin Bawah

Gambar 5.28 Penomoran Pada Ikatan Angin Bawah

Pendimensian Batang

- Profil. L 200x200x16-48,5

Profil L	Ukuran (mm)				F	Berat	Jarak titik berat (cm)			
	b	d	r	r1	(cm2)	(kg/m)	e	w	v	
200 x 200 x 16	200	16	18	9	61,8	48,5	5,52	14,1	7,80	
Ix = Iy (cm4)	Wx = Wy (cm3)	ix = iy (cm)	kx = ky	Iξ (cm4)	iξ (cm)	kξ	Iη (cm4)	Wη (cm3)	iη (cm)	kη
2340	162	6,15	1,65	3740	7,78	1,03	943	121	3,91	4,05

Dari hasil perhitungan program SAP 2000 versi 7.42, diperoleh gaya batang terbesar, dengan resiko tekuk adalah :

Batang	Gaya Batang (P) kg	Panjang (L) m	Keterangan
34 & 65	-7757,50	10,649	tekan

Batang tekan

- Profil L 200x200x16-48,5 kg/m
S = -7757,50 kg (batang 34 & 65)

$$L_k = \sqrt{9,403^2 + 5^2} = 10,649 \text{ m}$$

Rumus umum menurut PPBBI hal 9 Bab 4.1 Pasal 1 dan 2, untuk stabilitas batang tekan terhadap bahaya tekuk :

$$\frac{(S \times \omega)}{F} < \sigma \text{ ijin baja}$$

Dimana :

S = gaya tekan pada batang tersebut

F = luas penampang batang

ω = faktor tekuk yang tergantung dari kelangsingan dan macam bajanya

Menghitung kelangsingan batang tunggal :

$$\lambda = \frac{L_k}{I_{\min}} = \frac{1064,9}{3,91} = 272,352 \text{ cm}$$

$$\lambda_g = \pi \times \sqrt{\frac{E}{0,7 \times \sigma_1}} = 3,14 \times \sqrt{\frac{2,1 \times 10^5}{0,7 \times 240}} = 111,016$$

$$\lambda_s = \frac{\lambda}{\lambda_g} = \frac{272,352}{111,016} = 2,453$$

Untuk $\lambda_s \geq 1$:

$$\begin{aligned}\omega &= 2,381 \times \lambda_s^2 \\ &= 2,381 \times (2,453)^2 \\ &= 14,326\end{aligned}$$

Maka :

$$\frac{(S \times \omega)}{F} = \frac{7757,50 \times 14,326}{61,8} = 1798,283 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots \text{OK}$$

5.2.10 Perencanaan Sambungan Pertambahan Angin

Sambungan pertambahan angin direncanakan menggunakan pelat 10 mm, dengan alat penyambung baut Ø 5/8" (15,9 mm)

Pengaturan jarak antar baut (berdasar PPBBI hal 70) :

$2,5 d \leq s \leq 7 d$, atau $14 t$ s = jarak antar sumbu baut pada arah horizontal

$2,5 d \leq u \leq 7 d$, atau $14 t$ u = jarak antar sumbu baut pada arah vertical

$1,5 d \leq s_1 \leq 3 d$, atau $6 t$ s_1 = jarak sumbu baut paling luar dengan bagian yang disambung

Jarak antar sumbu baut pada arah horizontal (s) :

$2,5 d \leq s \leq 7 d$

$39,75 \leq s \leq 111,3$ diambil 40 mm

Jarak antar sumbu baut pada arah vertikal (u) :

$2,5 d \leq u \leq 7 d$

$39,75 \leq s \leq 111,3$ diambil 90 mm

Jarak sumbu baut paling luar dengan bagian yang disambung (s_1) :

$1,5 d \leq s_1 \leq 3 d$

$23,85 \leq s_1 \leq 47,7$ diambil 40 mm

a. Pertambahan angin atas

1. Profil IWF 250x175x7x11-44,1 dengan rangka induk IWF 406x403x16x24-200

Data teknis perencanaan baut :

- Tebal plat penyambung (δ) = 10 mm
- Diameter baut (\varnothing) = 5/8" (15,9 mm)
- Pmaks = -3899,840 kg (batang 17 & 47)

Perhitungan gaya yang bekerja pada sambungan :

$$\frac{\delta}{d} = \frac{10}{15,9} = 0,628 > 0,314 \text{ (pengaruh geser)}$$

$$n_{ds} = \frac{P}{2 \times \sigma \times \delta \times d} = \frac{4080,11}{2 \times 1867 \times 1 \times 1,59} = 0,687 \sim \text{diambil 4 baut}$$

Tegangan yang terjadi pada baut :

$$\begin{aligned} \sigma_{BAUT} &= \frac{P}{2 \times n_{BAUT} \times \left(\frac{1}{4} \times \pi \times d^2 \right)} < 0,6 \times \bar{\sigma} \\ &= \frac{3899,840}{2 \times 4 \times \left(\frac{1}{4} \times 3,14 \times 1,59^2 \right)} < 1120,2 \text{ kg/cm}^2 \\ &= 245,590 \text{ kg/cm}^2 < 1120,2 \text{ kg/cm}^2 \end{aligned}$$

2. Profil L 80.80.8 dengan rangka induk IWF 406x403x16x24-200

Data teknis perencanaan baut :

- Tebal plat penyambung (δ) = 10 mm
- Diameter baut (\varnothing) = 5/8" (15,9 mm)
- Pmaks = 2956,51 kg (batang 31 & 33)

Perhitungan gaya yang bekerja pada sambungan :

$$\frac{\delta}{d} = \frac{10}{15,9} = 0,628 > 0,314 \text{ (pengaruh geser)}$$

$$n_{ds} = \frac{P}{2 \times \sigma \times \delta \times d} = \frac{2956,51}{2 \times 1867 \times 1 \times 1,59} = 0,497 \sim \text{diambil 2 baut}$$

Tegangan yang terjadi pada baut :

$$\begin{aligned} \sigma_{BAUT} &= \frac{P}{2 \times n_{BAUT} \times \left(\frac{1}{4} \times \pi \times d^2 \right)} < 0,6 \times \bar{\sigma} \\ &= \frac{2956,51}{2 \times 2 \times \left(\frac{1}{4} \times 3,14 \times 1,59^2 \right)} < 1120,2 \text{ kg/cm}^2 \\ &= 372,450 \text{ kg/cm}^2 < 1120,2 \text{ kg/cm}^2 \end{aligned}$$

Gambar 5.29 Sambungan Ikatan Angin Atas

b. Pertambahan angin bawah

Menggunakan profil L 200x200x16-48,5 kg/m dengan rangka induk profil IWF 406x403x16x24-200

Data teknis perencanaan baut :

1. Tebal plat penyambung (δ) = 10 mm
2. Diameter baut (\varnothing) = 5/8" (15,9 mm)
3. Pmaks = -7757,50 kg (batang 34& 65)

Perhitungan gaya yang bekerja pada sambungan :

$$\frac{\delta}{d} = \frac{10}{15,9} = 0,628 > 0,314 \text{ (pengaruh geser)}$$

$$n_{ds} = \frac{P}{2 \times \bar{\sigma} \times \delta \times d} = \frac{-7757,50}{2 \times 1867 \times 1 \times 1,59} = 1,306 \sim \text{diambil 4 baut}$$

Tegangan yang terjadi pada baut :

$$\begin{aligned} \sigma_{BAUT} &= \frac{P}{2 \times n_{BAUT} \times \left(\frac{1}{4} \times \pi \times d^2 \right)} < 0,6 \times \bar{\sigma} \\ &= \frac{-7757,50}{2 \times 4 \times \left(\frac{1}{4} \times 3,14 \times 1,59^2 \right)} < 1120,2 \text{ kg/cm}^2 \\ &= 488,630 \text{ kg/cm}^2 < 1120,2 \text{ kg/cm}^2 \end{aligned}$$

Gambar 5.30 Sambungan Ikatan Angin Bawah

5.2.11 Perencanaan Rangka Induk

Gambar 5.31 Struktur Rangka Induk

a. Data Perencanaan

Tebal pelat	= 20 cm
Tebal perkerasan	= 5 cm
Genangan air	= 5 cm
Lebar lantai kendaraan	= 700 cm
Lebar trotoir	= 100 cm
Tebal trotoir	= 25 cm
G memanjang	= IWF 350.175.7.11-49,6 berat = 49,6 kg/m
G melintang	= IWF 708.302.15.28-215 berat = 213 kg/m
Ikatan angin atas	= IWF 250.175.7.11-44,1 berat = 44,1 kg/m = L 80.80.8-9,6 berat = 9,6 kg/m
Ikatan angin bawah	= L 200.200.16-48,5 berat = 48,5 kg/m
Sandaran	= Pipa D 76,3 dengan berat = 7,13 kg/m
Rangka Utama	= IWF 428.407.20.35-283 berat = 283 kg/m

b. Pembebanan

Asumsi beban antara rangka induk ditahan masing-masing $\frac{1}{2}$ nya oleh rangka induk. Dimensi Rangka diasumsikan sama untuk semua rangka.

1. Beban rangka induk

- Buhul 1 dan 17

$$= (1/2 \text{ diagonal}) + (1/2 \text{ horisontal})$$

$$= (1/2 \times 6,78 \times 283) + (1/2 \times 5 \times 283)$$

$$= 1366,48 \text{ kg}$$

- Buhul 18 dan 33 $= (1/2 \times 2 \text{ diagonal}) + (1/2 \times \text{horizontal})$
 $= (1/2 \times 2 \times 6,78 \times 283) + (1/2 \times 5 \times 283)$
 $= 2152,96 \text{ kg}$
- Buhul 2-16 dan 19-32 $= (1/2 \times 2 \text{ diagonal}) + (1/2 \times 2 \text{ horizontal})$
 $= (1/2 \times 2 \times 6,78 \times 283) + (1/2 \times 2 \times 5 \times 283)$
 $= 2732,96 \text{ kg}$

Penambahan beban sebesar 10 %, sebagai asumsi berat pelat buhul beserta bautnya.

- Buhul 1 dan 17 $= 110\% \times 1366,48 \text{ kg} = 1503,128 \text{ kg}$
- Buhul 18 dan 33 $= 110\% \times 2152,96 \text{ kg} = 2368,256 \text{ kg}$
- Buhul 2-16 dan 19-32 $= 110\% \times 2732,96 \text{ kg} = 3006,256 \text{ kg}$

2. Beban gelagar memanjang

5 buah profil IWF 350.175.7.11-49,6 kg/m

Distribusi beban pada tiap buhul :

- Buhul 1 dan 17 $= \left(\frac{5 \times 49,6}{2} \right) \times \frac{1}{2} = 62 \text{ kg}$
- Buhul 2-16 $= \left(\frac{5 \times 49,6}{2} \right) \times 2 \times \frac{1}{2} = 124 \text{ kg}$

3. Beban gelagar melintang

17 buah profil IWF 708.302.15.28-215

Distribusi beban pada tiap buhul :

- Buhul 1-17 $= \left(\frac{9 \times 215}{2} \right) = 958,5 \text{ kg}$

4. Beban pelat beton (termasuk dibawah trotoar)

Tebal pelat beton = 20 cm

Distribusi beban pada tiap buhul :

- Buhul 1 dan 17 $= \left(\frac{9 \times 5 \times 0,2 \times 25}{2} \right) \times \frac{1}{2} = 56,25 \text{ kg}$
-

- Buhul 2-16 $= \left(\frac{9 \times 5 \times 0,2 \times 25}{2} \right) = 112,5 \text{ kg}$

5. Beban lapis perkerasan

Tebal lapis perkerasan = 5 cm

Distribusi beban pada tiap buhul :

- Buhul 1 dan 17 $= \left(\frac{7 \times 5 \times 0,05 \times 22}{2} \right) \times \frac{1}{2} = 9,625 \text{ kg}$
- Buhul 2-16 $= \left(\frac{7 \times 5 \times 0,05 \times 22}{2} \right) = 19,25 \text{ kg}$

6. Beban trotoar

Tebal trotoar = 25 cm

Lebar trotoar = 1,0 m

Distribusi beban pada tiap buhul :

- Buhul 1 dan 17 $= (5 \times 1 \times 0,25 \times 25) \times \frac{1}{2} = 15,625 \text{ kg}$
- Buhul 2-16 $= (5 \times 1 \times 0,25 \times 25) = 31,250 \text{ kg}$

7. Beban air hujan

Tebal genangan = 5 cm

Distribusi beban pada tiap buhul :

- Buhul 1 dan 17 $= \left(\frac{9 \times 5 \times 0,05 \times 10}{2} \right) \times \frac{1}{2} = 5,625 \text{ kg}$
- Buhul 2-16 $= \left(\frac{9 \times 5 \times 0,05 \times 10}{2} \right) = 11,25 \text{ kg}$

8. Beban pipa sandaran

Pipa sandaran Ø 76,3 mm, dengan berat 7,13 kg/m

Berat total pipa sandaran = $2 \times 80 \times 7,13 = 1140,8 \text{ kg}$

Distribusi beban pada tiap buhul :

- Buhul 1 dan 17 = $\frac{1140,8}{16} \times \frac{1}{2} = 35,65 \text{ kg}$
- Buhul 2-16 = $\frac{1140,8}{16} = 71,3 \text{ kg}$

9. Beban ikatan angin atas

Profil IWF 250.175.7.11 – 44,1 berat = 44,1 kg/m

Profil L 80.80.8-9,6 berat = 9,6 kg/m

Distribusi beban pada tiap buhul :

- Buhul 18 dan 33 = $((\frac{1}{2} \times 44,1 \times 10,29) + (\frac{1}{2} \times 9,6 \times 10,29)) \times \frac{1}{2}$
 $= (226,894 + 49,392) \times \frac{1}{2}$
 $= 138,143 \text{ kg}$
- Buhul 19-32 = $((\frac{1}{2} \times 44,1 \times 10,29) + (\frac{1}{2} \times 9,6 \times 10,29)) \times \frac{1}{2} \times 2$
 $= (226,894 + 49,392) \times \frac{1}{2} \times 2$
 $= 276,286 \text{ kg}$

10. Beban ikatan angin bawah

Profil L 200.200.16-48,5 berat = 48,5kg/m

Distribusi beban pada tiap buhul :

- Buhul 1 dan 17 = $(2 \times 48,5 \times 10,29) \times \frac{1}{2} \times \frac{1}{2}$
 $= 249,532 \text{ kg}$
 - Buhul 2-16 = $(2 \times 48,5 \times 10,29) \times \frac{1}{2} \times \frac{1}{2} \times 2$
 $= 499,065 \text{ kg}$
-

d. Perhitungan gaya batang akibat beban dinamis

- Beban terbagi rata (“q”)

Bentang jembatan = 80 m, maka :

$$\begin{aligned}q &= 1.1 (1 + 30/L) \text{ t/m}' \quad \text{untuk } L > 60 \text{ m} \\&= 1.1 (1 + 30/80) \text{ t/m}' \\&= 1,512 \text{ t/m}\end{aligned}$$

- Beban terbagi rata sepanjang gelagar melintang untuk lebar 5,5 m

$$q_1 = \frac{q \times 5,5}{2,75} = \frac{1,512 \times 5,5}{2,75} = 3,024 \text{ t/m} = 3024 \text{ kg/m}$$

- Beban terbagi rata untuk lebar sisanya (0,75 m)

$$q_2 = 50 \% \times \left(\frac{q}{2,75} \right) \times 0,75 = 0,206 \text{ t/m} = 206 \text{ kg/m}$$

- Beban terbagi rata pada trotoar

$$q_3 = 1,00 \times 500 \text{ kg/m} = 500 \text{ kg/m}$$

$$\begin{aligned}q_{\text{tot}} &= 3024 + (2 \times 206) + (2 \times 500) \text{ kg/m} \\&= 4436 \text{ kg/m}\end{aligned}$$

Beban q yang diterima satu sisi rangka :

$$q = \frac{4436}{2} = 2218 \text{ kg/m} = 2,218 \text{ t/m}$$

Gambar 5.33 Beban “q” Yang Bekerja Pada Satu Rangka

- Beban “P”

$$P = 12 \text{ ton}$$

$$\text{Koefesien kejut (K)} = 1 + \left(\frac{20}{(50 + L)} \right)$$

$$K = 1 + \left(\frac{20}{(50 + 80)} \right) = 1,153$$

- Beban P bekerjasepanjang gelagar melintang untuk lebar 5,5 m

$$P_1 = \frac{P}{2,75} \times K \times 5,5 = \frac{12}{2,75} \times 1,153 \times 5,5 = 27,672 \text{ t}$$

- Beban P untuk lebar sisanya (50% dari P1)

$$P_2 = 50 \% \times \frac{P}{2,75} \times K \times 0,75 = 50\% \times \frac{12}{2,75} \times 1,153 \times 0,75 = 1,886 \text{ t}$$

Gambar 5.34 Penyebaran Beban ” P ”

$$P_{\text{tot}} = 27,672 + (2 \times 1,886) = 31,444 \text{ ton}$$

Beban yang diterima atu sisi rangka :

$$P = \frac{31,444}{2} = 15,722 \text{ ton}$$

- **S1 = S16**

$$S = (0,5 \times 0,372 \times 80) \times 2,218 + (0,372 \times 15,722) = 38,851 \text{ t}$$

- **S2 = S15**

$$S = ((0,5 \times 5 \times 0,714) + (\frac{0,714 + 1,040}{2} \times 5) + (0,5 \times 70 \times 1,040)) \times 2,218 + (1,040 \times 15,722) = 110,770 \text{ t}$$

- **S3 = S14**

$$S = ((0,5 \times 5 \times 0,668) + (\frac{0,668 + 1,330}{2} \times 5) + (\frac{1,610 + 1,330}{2} \times 5) + (0,5 \times 65 \times 1,610)) \times 2,218 + (1,610 \times 15,722) = 172,454 \text{ t}$$

- **S4 = S13**

$$S = ((0,5 \times 5 \times 0,618) + (\frac{0,618+1,240}{2} \times 5) + (\frac{1,850+1,240}{2} \times 5) + (\frac{1,850+2,080}{2} \times 5) + (0,5 \times 60 \times 2,080)) \times 2,218 + (2,080 \times 15,722) = 234,017 \text{ t}$$

- **S5 = S12**

$$S = ((0,5 \times 20 \times 2,270) + (\frac{2,270+2,450}{2} \times 5) + (0,5 \times 25 \times 2,450)) \times 2,218 + (2,450 \times 15,722) = 182,965 \text{ t}$$

- **S6 = S11**

5.2.12 Pendimensian Batang Rangka Induk

1) Batang Horizontal Bawah (Batang Tarik)

Direncanakan menggunakan profil IWF 428 x 407 x 20 x 35 - 283

Data Profil :

A = 428 mm	$i_x = 18,2 \text{ cm}$
B = 407 mm	$i_y = 10,4 \text{ cm}$
t1 = 20 mm	$W_x = 5570 \text{ cm}^3$
t2 = 35 mm	$W_y = 1930 \text{ cm}^3$
F = 360,7 cm ²	
$I_x = 119000 \text{ cm}^4$	
$I_y = 39400 \text{ cm}^4$	

$$S = 529,640 \text{ t} = 529640 \text{ kg (batang 8 \& 9)}$$

$$\begin{aligned} F_{nt} &= 0,85 \times F \text{ profil} \\ &= 0,85 \times 360,7 \\ &= 306,595 \text{ cm}^2 \end{aligned}$$

Cek Tegangan :

$$\begin{aligned} \sigma &= \frac{S}{F_{nt}} < 1867 \text{ kg/cm}^2 \\ &= \frac{529640}{306,595} < 1867 \text{ kg/cm}^2 \\ &= 1727,490 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \dots \text{OK} \end{aligned}$$

2) Batang Horizontal Atas (Batang Tekan)

Direncanakan menggunakan profil IWF 428 x 407 x 20 x 35 - 283

$$S = -527,033 \text{ t} = -527033 \text{ kg (batang 23 \& 25)}$$

$$Lk = 500 \text{ cm}$$

Rumus umum menurut PPBBI hal 9 Bab 4.1 Pasal 1 dan 2, untuk stabilitas batang tekan terhadap bahaya tekuk :

$$\frac{(S \times \omega)}{F} < \sigma \text{ ijin baja}$$

Dimana :

S = gaya tekan pada batang tersebut

F = luas penampang batang

ω = faktor tekuk yang tergantung dari kelangsingan dan macam bajanya

Menghitung kelangsingan batang tunggal :

$$\lambda = \frac{Lk}{I_{\min}} = \frac{500}{10,4} = 48,076$$

$$\lambda_g = \pi \times \sqrt{\frac{E}{0,7 \times \sigma_1}} = 3,14 \times \sqrt{\frac{2,1 \times 10^5}{0,7 \times 240}} = 111,015$$

$$\lambda_s = \frac{\lambda}{\lambda_g} = \frac{48,076}{111,015} = 0,433$$

Untuk $0,183 < \lambda_s < 1$:

$$\begin{aligned} \omega &= \frac{1,41}{1,593 - \lambda_s} \\ &= \frac{1,41}{1,593 - 0,433} \\ &= 1,16 \end{aligned}$$

Maka :

$$\frac{(S \times \omega)}{F} = \frac{527033 \times 1,160}{360,7} = 1694,922 \text{ Mpa} < 1867 \text{ kg/cm}^2 \dots \text{OK}$$

3) Batang Diagonal (Batang Tarik)

Direncanakan menggunakan profil IWF 428 x 407 x 20 x 35 - 283

$$S = 158,545 \text{ t} = 158545 \text{ kg (batang 47 \& 48)}$$

$$F_{nt} = 0,85 \times F_{\text{profil}} = 0,85 \times 360,7 = 306,595 \text{ cm}^2$$

Cek Tegangan :

$$\begin{aligned}\sigma &= \frac{S}{F_{nt}} < 0,75 \times 1867 \text{ kg/cm}^2 \\ &= \frac{158545}{306,595} < 1400,25 \text{ kg/cm}^2 \\ &= 517,115 < 1400,25 \text{ kg/cm}^2 \dots \text{OK}\end{aligned}$$

4) Batang Diagonal (Batang Tekan)

Direncanakan menggunakan profil IWF 428 x 407 x 20 x 35 - 283

$$S = -144,758 \text{ t} = -144758 \text{ kg (batang 33 \& 62)}$$

$$L_k = 677,790 \text{ cm}$$

Rumus umum menurut PPBBI hal 9 Bab 4.1 Pasal 1 dan 2, untuk stabilitas batang

$$\text{tekan terhadap bahaya tekuk : } \frac{(S \times \omega)}{F} < \sigma \text{ ijin baja}$$

Menghitung kelangsingan batang tunggal :

$$\lambda = \frac{L_k}{I_{\min}} = \frac{677,790}{10,4} = 65,172$$

$$\lambda_g = \pi \times \sqrt{\frac{E}{0,7 \times \sigma_1}} = 3,14 \times \sqrt{\frac{2,1 \times 10^5}{0,7 \times 240}} = 111,015$$

$$\lambda_s = \frac{\lambda}{\lambda_g} = \frac{65,172}{111,015} = 0,587$$

Untuk $0,183 < \lambda_s < 1$:

$$\omega = \frac{1,41}{1,593 - \lambda_s} = \frac{1,41}{1,593 - 0,587} = 1,401$$

Maka :

$$\frac{(S \times \omega)}{F} = \frac{(144758 \times 1,401)}{360,7} = 542,878 < 186,7 \text{ Mpa} \dots \text{OK}$$

5.2.13 Sambungan Rangka Utama

a. Sambungan Antar Rangka Utama

Sambungan Antar rangka utama direncanakan menggunakan alat penyambung dengan baut diameter 25,4 mm

Data teknis perencanaan jumlah baut :

- Tebal plat buhul (δ) = 30 mm
- Diameter baut = 25,4 mm
- Mutu baut = A325 ($\tau_t = 6350 \text{ kg/cm}^2$)

Pengaturan jarak antar baut (berdasar PPBBI hal 70) :

$2,5 d \leq s \leq 7 d$, atau $14 t \leq s$ = jarak antar sumbu baut pada arah horizontal

$2,5 d \leq u \leq 7 d$, atau $14 t \leq u$ = jarak antar sumbu baut pada arah vertikal

$1,5 d \leq s_1 \leq 3 d$, atau $6 t \leq s_1$ = jarak sumbu baut paling luar dengan bagian yang disambung

Jarak antar sumbu baut pada arah horizontal (s) :

$$2,5 d \leq s \leq 7 d$$

$$63,5 \leq s \leq 177,8 \quad \text{diambil } 80 \text{ mm}$$

Jarak antar sumbu baut pada arah vertikal (u) :

$$2,5 d \leq u \leq 7 d$$

$$63,5 \leq s \leq 177,8 \quad \text{diambil } 100 \text{ mm}$$

Jarak sumbu baut paling luar dengan bagian yang disambung (s_1) :

$$1,5 d \leq s_1 \leq 3 d$$

$$38,1 \leq s_1 \leq 76,2 \quad \text{diambil } 60 \text{ mm}$$

Sambungan Irisan 1 :

$$\frac{\delta}{d} = \frac{30}{25,4} = 1,180 > 0,314 \text{ (Pengaruh Geser)}$$

Jumlah baut untuk tiap sisi pelat sambungan:

$$n_{gsr} = \frac{S}{0,6 \times \sigma \times 2 \times \frac{1}{4} \pi d^2}$$

$$n_{gsr} = \frac{S}{0,6 \times 6350 \times 2 \times \frac{1}{4} \times 3,14 \times 2,54^2}$$

$$n_{gsr} = \frac{S}{38591,535}$$

Tabel 5.2 Perhitungan Jumlah Baut

Btg	Gaya batang	Pgeser	Jumlah	Dipakai
	(kg)	(kg)	Baut

b. Sambungan Antar Rangka Utama dengan Gelagar Melintang

Sambungan antara rangka utama dengan gelagar melintang direncanakan menggunakan pelat penyambung dengan tebal 20 mm yang dilas pada ujung gelagar melintang.

Perhitungan Sambungan Las :

$$D_{\text{POST}} \text{ gelagar melintang (P)} = 51563,749 \text{ kg}$$

$$\text{Tebal plat (t)} = 20 \text{ mm}$$

- Perhitungan luas bidang las

$$a \leq \frac{1}{2} t \sqrt{2}$$

$$a \leq \frac{1}{2} \times 20 \times \sqrt{2}$$

$$a \leq 14,142 \text{ mm, diambil } a = 12 \text{ mm}$$

- Panjang netto las (L_n)

$$L_B = \text{tinggi profil gelagar melintang} = 708 \text{ mm}$$

$$L_n = L_B - 3a$$

$$= 708 - (3 \times 12)$$

$$= 672 \text{ mm}$$

$$\text{Syarat panjang las : } 10.a \leq L_n \leq 40.a$$

$$10 \times 12 \leq L_n \leq 40 \times 12$$

$$120 \leq L_n \leq 480 \text{ mm}$$

$$\text{Panjang Las diambil } L_n = 400 \text{ mm}$$

- Luas bidang las (A)

$$A = 2 \times L_n \times a$$

$$= 2 \times 400 \times 12$$

$$= 11520 \text{ mm}^2 = 115,20 \text{ cm}^2$$

- Kekuatan las (\bar{P})

$$\bar{P} = 0,58 \times \bar{\sigma} \times A$$

$$= 0,58 \times 1867 \times 115,20$$

$$= 124745,472 \text{ kg}$$

Karena $\bar{P} \geq P$, maka sambungan las antara pelat penyambung dengan gelagar melintang pada ujungnya aman.

Sambungan antara pelat buhul dengan pelat penyambung direncanakan menggunakan baut mutu tinggi A 325 dengan diameter 1 " (25,4 mm)

Jarak antar sumbu baut pada arah horizontal (s) :

$$2,5 d \leq s \leq 7 d$$

$$63,5 \leq s \leq 177,8 \quad \text{diambil } 70 \text{ mm}$$

Jarak antar sumbu baut pada arah vertikal (u) :

$$2,5 d \leq u \leq 7 d$$

$$63,5 \leq s \leq 177,8 \quad \text{diambil } 80 \text{ mm}$$

Jarak sumbu baut paling luar dengan bagian yang disambung (s₁) :

$$1,5 d \leq s_1 \leq 3 d$$

$$38,1 \leq s_1 \leq 76,2 \quad \text{diambil } 40 \text{ mm}$$

Menentukan jumlah baut :

- Tebal plat buhul (δ) = 30 mm
- Diameter baut = 25,4 mm
- Tegangan geser ijin ($\bar{\sigma}$) = $0,58 \times \bar{\sigma} = 1082 \text{ kg/cm}^2$

Sambungan Irisan 1 :

$$\frac{\delta}{d} = \frac{30}{25,4} = 1.181 > 0,314 \text{ (Pengaruh Geser)}$$

$$n = \frac{P}{\tau \left(\frac{1}{4} \times \pi \times d^2 \right)} = \frac{51563,749}{1082 \times \left(\frac{1}{4} \times 3,14 \times 2,54^2 \right)}$$

$$= 8,960 \longrightarrow \text{dipakai } 10 \text{ baut}$$

5.2.14 Perhitungan Stabilitas Pelat Buhul

a. Buhul A

Gambar 5.35 Detail Buhul A

Tinjau Pot. A – A

Analisa Penampang :

- A bruto = $3 \times 130,45 = 391,35 \text{ cm}^2$
- A baut = $2 \times (3 \times 2,54) = 15,24 \text{ cm}^2$
- A netto = A bruto - A netto = $391,35 - 15,24 = 376,11 \text{ cm}^2$
- Titik berat penampang pada pot. A – A

$$Y = \frac{(376,11 \times 65,2) - ((3 \times 2,54) \times (13 + 22,75))}{376,11} = 64,475 \text{ cm}$$

$$\begin{aligned} \bullet I_{\text{netto}} &= \left(\left(\frac{1}{12} \times 3 \times 130,45^3 \right) + (391,35 \times (65,2 - 64,675)^2) \right) - \\ &\quad (3 \times 2,54 \times ((13 - 64,675)^2 + (33,15 - 64,675)^2)) \\ &= (554973,516 + 109,930) - (7,62 \times (2672,373 + 995,087)) \\ &= 527137,400 \text{ cm}^4 \end{aligned}$$

$$\bullet \text{Watas} = \frac{I_{\text{netto}}}{H - Y} = \frac{527137,400}{130,45 - 64,475} = 8116,049 \text{ cm}^3$$

- $W_{bawah} = \frac{Inetto}{Y} = \frac{527137,400}{64,475} = 8178,842 \text{ cm}^3$

Gaya – Gaya yang bekerja :

- $N = \frac{1}{2} \times \left(\left(\frac{63,477 \times 12}{14} \right) + (-121,323 \times \cos 68.090) \right) = 4,568 \text{ Ton}$
- $D = \frac{1}{2} \times (-121,323 \sin 68.090) = -56,279 \text{ Ton}$
- $M = \frac{1}{2} \times \left(\left(\frac{63,477 \times 12 \times (64,475 - 13)}{14} \right) + (-121,323 \cos 68.090 \times (64,475 - 33,15)) \right)$
 $= 691,565 \text{ Ton.cm}$

Tegangan Yang Terjadi :

- Akibat N

$$\sigma_n = \frac{N}{A_{netto}} = \frac{4568}{376,11} = 12,145 \text{ kg/cm}^2$$

- Akibat D

$$\tau = \frac{D}{A_{netto}} = \frac{-56279}{376,11} = -149,634 \text{ kg/cm}^2$$

- Akibat M

$$\sigma_{atas} = \frac{M}{W_{atas}} = \frac{691565}{8116,049} = 85,209 \text{ kg/cm}^2$$

$$\sigma_{bawah} = \frac{M}{W_{bawah}} = \frac{691565}{8178,842} = 84,555 \text{ kg/cm}^2$$

Tegangan total :

$$\sigma_{atas} = 85,209 - 12,145 = 73,064 \text{ kg/cm}^2$$

$$\sigma_{bawah} = 84,555 - 12,145 = 72,410 \text{ kg/cm}^2$$

Tegangan idiil :

$$\sigma_{idiil} = \sqrt{(73,064)^2 + (3(-149,634))^2} = 269,275 \text{ kg/cm}^2$$

Syarat Keamanan :

$$\sigma_{diil} < \bar{\sigma}$$

$$269,275 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \text{OK}$$

b. Buhul B

Tegangan total :

$$\sigma_{atas} = -455,253 + 214,065 = -241,188 \text{ kg/cm}^2$$

$$\sigma_{bawah} = -443,934 + 229,869 = -214,065 \text{ kg/cm}^2$$

Tegangan idiil :

$$\sigma_{idiil} = \sqrt{-(241,188)^2 + (3(-189,497))^2} = 407,306 \text{ kg/cm}^2$$

Syarat Keamanan :

$$\sigma_{idiil} < \bar{\sigma}$$

$$407,306 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \text{OK}$$

d. Buhul D

Gambar 5.38 Detail Buhul 19

Tinjau Pot. A – A

Analisa Penampang :

- A bruto = 3 x 134,45 = 403,35 cm²
- A baut = 2 x (3 x 2,54) = 15,24 cm²
- A netto = A bruto - A netto = 403,35 - 15,24 = 388,11 cm²
- Titik berat penampang pada pot. A – A

$$Y = \frac{(388,11 \times 67,225) - ((3 \times 2.54) \times (13 + 33,15))}{388,11} = 66,318 \text{ cm}$$

- $I_{\text{netto}} = \left(\left(\frac{1}{12} \times 3 \times 134,45^3 \right) + \left(403,35 \times (67,225 - 66,318)^2 \right) \right) - \left(3 \times 2.54 \times \left((13 - 66,318)^2 + (33,15 - 66,318)^2 \right) \right)$
 $= (607606,524 + 331,815) - (7.62 \times (2842,809 + 1100,116))$
 $= 577893,251 \text{ cm}^4$
- $\text{Watas} = \frac{I_{\text{netto}}}{H - Y} = \frac{577893,251}{134,45 - 66,318} = 8481,965 \text{ cm}^3$
- $\text{Wbawah} = \frac{I_{\text{netto}}}{Y} = \frac{577893,251}{66,318} = 8713,973 \text{ cm}^3$

Gaya – Gaya yang bekerja :

- $N = \frac{1}{2} \times \left(\left(\frac{-410,349 \times 12}{14} \right) + (98,870 \times \cos 68.090) \right) = -157,424 \text{ Ton}$
- $D = \frac{1}{2} \times (98,870 \sin 68.090) = 45,628 \text{ Ton}$
- $M =$
 $\frac{1}{2} \times \left(\left(\frac{-410,349 \times 12 \times (66,318 - 13)}{14} \right) - (98,870 \times \cos 68.090 \times (66,318 - 33,15)) \right)$
 $= -1549,264 \text{ Ton.cm}$

Tegangan Yang Terjadi :

- Akibat N

$$\sigma_n = \frac{N}{A_{\text{netto}}} = \frac{-157424}{388,11} = -405,616 \text{ kg/cm}^2$$

- Akibat D

$$\tau = \frac{D}{A_{\text{netto}}} = \frac{45628}{388,11} = 117,564 \text{ kg/cm}^2$$

- Akibat M

$$\sigma_{\text{atas}} = \frac{M}{W_{\text{atas}}} = \frac{-1549264}{8481,965} = -182,653 \text{ kg/cm}^2$$

$$\sigma_{bawah} = \frac{M}{W_{bawah}} = \frac{-1549264}{8713,973} = -177,970 \text{ kg/cm}^2$$

Tegangan total :

$$\sigma_{atas} = -182,653 + 405,616 = 222,963 \text{ kg/cm}^2$$

$$\sigma_{bawah} = -177,970 + 405,616 = 227,646 \text{ kg/cm}^2$$

Tegangan idiil :

$$\sigma_{idiil} = \sqrt{(227,646)^2 + (3 (117,564))^2} = 308,428 \text{ kg/cm}^2$$

Syarat Keamanan :

$$\sigma_{idiil} < \bar{\sigma}$$

$$308,428 \text{ kg/cm}^2 < 1867 \text{ kg/cm}^2 \text{OK}$$

5.2.15 Perhitungan Lendutan Rangka Induk

$$\text{Rumus} = \delta_m = \frac{(S_{DL} + S_{LL}) \times L \times S_o}{A \times E}$$

Keterangan :

δ_m = lendutan dititik ditengah

S_{DL} = Gaya akibat beban mati

S_{LL} = Gaya akibat beban hidup

L = Panjang Batang

S_o = Gaya batang akibat beban P ditengah

A = Luas Profil

E = Modulus Elastisitas Baja ($2,1 \times 10^6 \text{ kg/cm}^2$)

Tabel 5.3 Perhitungan Lendutan Rangka Induk

Batan g	$S_{DL} + S_{LL}$ (kg)	L (cm)	S_o (kg)	A (cm ²)	E (kg/cm ²)	δ (cm)

62	-144958.280	677.779	-0.525	273.6	2100000	0.090
63	-121323.420	677.779	-0.533	273.6	2100000	0.076
Σ						14,496

Cek lendutan :

$$\Delta \leq 1/500 \times 8000$$

$$14,496 \text{ cm} \leq 16 \text{ cm} \dots\dots\dots \text{OK}$$

5.2.16 Perhitungan Chamber

Gambar 5.39 Perhitungan Chamber

- Titik (0,0)

$$X = 0, Y = 0 \quad ax^2 + bx + c = 0, c = 0$$

- Lendutan ijin (δ ijin) = $\frac{L}{500}$

$$= \frac{8000}{500} = 16 \text{ cm}$$

- Titik maks (4000,16)

$$y = ax^2 + bx + c \quad 16 = a \cdot 4000^2 + 4000 \cdot b + c$$

$$16 = 4000^2 a + 4000 b \quad (1)$$

- Titik (8000,0)

$$y = ax^2 + bx + c \quad 0 = a \cdot 8000^2 + 8000 \cdot b + c$$

$$0 = 8000^2 a + 8000 b \quad (2)$$

$$b = -\frac{8000^2 a}{8000} = -8000a$$

Persamaan (1) dan (2) :

$$16 = 4000^2 a + 4000 b$$

$$16 = 4000^2 a + 4000 (-8000 a)$$

$$16 = 16000000 a - 32000000 a$$

$$16 = 16000000 a - 32000000 a$$

$$a = -\frac{16}{16.10^6}$$
$$= -10^{-6}$$

$$b = -8000(-10^{-6})$$
$$= 8.10^{-3}$$

$$y = -10^{-6}x^2 + 8.10^{-3}x$$

lendutan maksimum terjadi pada tengah bentang $x = 4000$

$$x = 4000 \implies y = -10^{-6}x^2 + 8.10^{-3}x$$
$$y = -10^{-6}.(4000^2) + 8.10^{-3}(4000)$$
$$y = -10^{-6}.(4000^2) + 8.10^{-3}(4000)$$
$$= -16 + 32$$
$$= 16 \text{ cm}$$

5.3 PERHITUNGAN BANGUNAN BAWAH

Fungsi utama bangunan bawah jembatan adalah untuk menyalurkan semua beban yang bekerja pada bangunan atas ke tanah. Perencanaan bangunan bawah bertujuan untuk mendapatkan konstruksi bawah yang kuat, dan efisien. Perhitungan bangunan bawah meliputi :

- Perhitungan Pelat Injak
- Perhitungan Abutment
- Perhitungan Tiang Pancang

A. Data Tanah

Data dari hasil penyelidikan tanah, dapat disimpulkan bahwa :

- Pada Kedalaman $\pm 0,00$ meter sampai dengan $-1,00$ meter, lapisan tanah berupa jenis lanau kepasiran berwarna coklat tua.
- Kedalaman $-1,00$ meter sampai $-2,00$ lapisan tanah berupa jenis lanau kepasiran campur koral dan kerikil dengan nilai SPT $> 60,00$.
- Kedalaman $-2,00$ meter sampai dengan $-10,00$ meter lapisan tanah berupa jenis koral dengan nilai N SPT $> 60,00$.
- Muka air tanah terdapat pada kedalaman $-1,00$ meter dari permukaan tanah setempat.
- Dipakai pesifikasi sebagai berikut :
 $\gamma_1 = 1,566 \text{ gr/cm}^3$
 $\theta_1 = 20^\circ$
 $C_1 = 0,02 \text{ kg/cm}^2$

B. Spesifikasi Bahan

Adapun spesifikasi bahan yang dipakai antara lain :

- Abutment direncanakan menggunakan beton mutu $f'c = 35 \text{ Mpa}$.
 - Pelat injak direncanakan menggunakan beton mutu $f'c = 35 \text{ Mpa}$.
 - Pondasi tiang pancang direncanakan menggunakan beton mutu $f'c = 40 \text{ Mpa}$.
 - Wingwall direncanakan menggunakan beton mutu $f'c = 35 \text{ Mpa}$.
-

- Tulangan yang digunakan :
 $\varnothing 8$ dan $\varnothing 10$ merupakan tulangan polos dengan mutu $f_y = 240$ Mpa.
 $D12, D14, D16, D25$ adalah tulangan ulir dengan mutu $f_y = 240$ Mpa

5.3.1 Perhitungan Pelat Injak

Gambar 5.40 Pelat Injak

A. Pembebanan Pelat Injak

Beban Mati

- Berat Aspal $= 0,05 \times 2200 \times 1 = 110 \text{ kg/m}$
 - Berat Agregat $= 0,55 \times 1450 \times 1 = 797,5 \text{ kg/m}$
 - Berat Air Hujan $= 0,05 \times 1000 \times 1 = 50 \text{ kg/m}$
 - Berat Sendiri Pelat $= 0,20 \times 2500 \times 1 = 500 \text{ kg/m}$
- berat total (q_{DL}) $= 1457,5 \text{ kg/m} = 14,575 \text{ kN/m}$

$$\begin{aligned}
 M_{DL} &= 1/8 \times Q_{DL} \times L^2 \\
 &= 1/8 \times 14,575 \times 2,5^2 \\
 &= 11,387 \text{ kNm}
 \end{aligned}$$

Beban Hidup

Bentang jembatan = 80 m, maka :

$$\begin{aligned}
 q &= 1.1 (1 + 30/L) \text{ t/m'} \quad \text{untuk } L > 60 \text{ m} \\
 &= 1.1 (1 + 30/80) \text{ t/m'} = 1,65 \text{ t/m}
 \end{aligned}$$

$$\begin{aligned}\text{Beban terbagi rata } (q_{LL}) &= \frac{1,65}{2,75} \times 2,5 \\ &= 1,5 \text{ t/m} = 1500 \text{ kg/m} = 15 \text{ kN/m}\end{aligned}$$

$$\begin{aligned}M_{LL} &= 1/8 \times Q_{DL} \times L^2 \\ &= 1/8 \times 15 \times 2,5^2 \\ &= 11,718 \text{ kNm}\end{aligned}$$

$$M_{TOTAL} = 11,387 + 11,718 = 23,105 \text{ kNm}$$

B. Penulangan Pelat Injak

$$f'_c = 35 \text{ Mpa}$$

$$f_y = 240 \text{ Mpa}$$

$$b = 100 \text{ cm}$$

$$\phi = 14 \text{ mm}$$

$$\begin{aligned}d &= h - p - \frac{1}{2} \phi \text{ tulangan} \\ &= 200 - 40 - 7 = 153 \text{ mm}\end{aligned}$$

$$\frac{Mu}{bd^2} = \rho \times 0,8 \times f_y \left(1 - 0,588 \times \rho \times \frac{f_y}{f'_c} \right)$$

$$\frac{23,105}{1 \times 1,52^2} = \rho \times 0,8 \times 2400 \left(1 - 0,588 \times \rho \times \frac{2400}{350} \right)$$

$$7741,44 \rho^2 - 1920 \rho + 10 = 0$$

$$\rho_1 = 0,242$$

$$\rho_2 = -1,03$$

$$\rho_{\min} = \frac{1,4}{f_y} = \frac{1,4}{240} = 0,005$$

$$\rho_{\max} = 0,75 \times \beta_1 \left(\frac{0,85 f'_c}{f_y} \times \frac{600}{600 + f_y} \right) \text{ dan } \beta_1 = 0,85$$

$$\rho_{\max} = 0,75 \times 0,85 \left(\frac{0,85 \times 350}{2400} \times \frac{600}{600 + 2400} \right) \text{ dan } \beta_1 = 0,85$$

$$\rho_{\max} = 0,015$$

Karena $\rho_{\min} > \rho > \rho_{\max} \rightarrow$ dipakai $\rho_{\min} = 0,005$

$$A_s = \rho \times b \times d = 0,005 \times 1000 \times 153 = 765 \text{ mm}^2$$

Dipakai tulangan $\phi 14 - 200$ ($A_s = 770 \text{ mm}^2$)

Menurut SKSNI T15-1991-03 pasal 3.16.12, dalam arah tegak lurus terhadap tulangan utama harus disediakan tulangan pembagi (tegangan susut dan suhu) untuk $f_y = 240 \text{ MPa}$

$$A_s = 0,0025 \times b \times d$$

$$A_s = 0,0025 \times 1000 \times 153 = 382,5 \text{ mm}^2$$

Digunakan tulangan bagi D10-200 ($A_s = 393 \text{ mm}^2$)

Gambar 5.41 Denah Penulangan Pelat Injak

f. Gaya Gempa

$$h = E \times M$$

dimana :

h : gaya horisontal akibat gempa

E : Koefesien gempa untuk daerah Jawa Tengah pada wilayah II = 0,14 (Peraturan Muatan Untuk Jalan Raya no.12/1970)

M : Muatan mati dari konstruksi yang ditinjau

- Gaya gempa terhadap berat sendiri abutment :

$$P_{BB} = 274,313 \text{ T}$$

$$Gh_{mB} = 274,313 \text{ T} \times 0,14 = 38,403 \text{ T}$$

$$Y_B = 2,509 \text{ m}$$

$$M = 38,403 \text{ T} \times 2,509 \text{ m} = 96,355 \text{ Tm}$$

- Gaya gempa terhadap bangunan atas :

$$P_{MB} = 128,720 \text{ T}$$

$$Gh_{mB} = 128,720 \text{ T} \times 0,14 = 18,020 \text{ T}$$

$$Y_{mB} = 6,037 \text{ m}$$

$$M = 18,020 \text{ T} \times 6,037 \text{ m} = 108,786 \text{ T}$$

- Gaya gempa terhadap tanah diatas abutment :

$$P_{TB} = 196,522 \text{ T}$$

$$Gh_{TB} = 196,522 \text{ T} \times 0,14 = 27,513 \text{ T}$$

$$Y_{TB} = 3,550 \text{ m}$$

$$M = 97,671 \text{ Tm}$$

g. Gaya Angin

Gambar 5.50 Bidang Rangka Induk

Data teknis perencanaan pertambahan angin :

Tekanan angin : 150 kg/m²

Panjang sisi bawah jembatan : 80 m

Panjang sisi atas jembatan : 75 m

Tinggi jembatan : 6,3 m

Luas bidang rangka utama : $\left(\frac{80 + 75}{2} \right) \times 6,3 = 488,25 \text{ m}^2$

Gambar 5.51 Penyebaran Beban Angin

- Beban angin pada sisi rangka jembatan (d_1) :

$$\begin{aligned} d1 &= 50\% \times ((30\% \times A)) \times w \\ &= 50\% \times ((30\% \times 488,25)) \times 150 \\ &= 10985,625 \text{ kg} \end{aligned}$$

- Beban angin pada muatan hidup setinggi 2 m (d_2) :

$$\begin{aligned} d2 &= 100\% \times w \times L \times 2 \\ &= 100\% \times 150 \times 80 \times 2 \\ &= 24000 \text{ kg} \end{aligned}$$

- Beban angin pada sisi rangka jembatan (d_1) :

$$\begin{aligned} d1 &= 50\% \times ((15\% \times A)) \times w \\ &= 50\% \times ((15\% \times 488,25)) \times 150 \\ &= 5492,812 \text{ kg} \end{aligned}$$

- Beban angin pada sisi rangka jembatan (s_1)

$$\begin{aligned} s1 &= \frac{1}{2} \times \text{tinggi jembatan} \\ &= \frac{1}{2} \times 6,30 \text{ m} \\ &= 3,15 \text{ m} \end{aligned}$$

- Beban angin pada muatan hidup setinggi 2 m (s_2)

Tinggi profil gelagar melintang (h_1) : 70,8 cm (708x302x15x28-215)

Tebal sayap gelagar melintang (h_2) : 2,8 cm

Lebar profil rangka induk (h_3) : 40,3 cm (428x407x20x35-283)

Tebal plat lantai kendaraan (h_4) : 20 cm

Tebal perkerasan (h_5) : 5 cm

Tinggi bidang vertikal beban hidup (h_6) : 200 cm

$$\begin{aligned} s_2 &= \left(h_1 - h_2 - \frac{h_3}{2} \right) + h_4 + h_5 + \frac{h_6}{2} \\ &= (70,8 - 2,8 - 20,35) + 20 + 5 + 100 \\ &= 173,35 \text{ cm} = 1,733 \text{ m} \end{aligned}$$

Lengan terhadap B :

$$Y_1 = Y_2 = 3,15 + 6,037 = 9,187 \text{ m}$$

$$Y_3 = 1,733 + 6,037 = 7,767 \text{ m}$$

Momen terhadap titik B :

$$\begin{aligned}M_B &= d_1 \times y_1 + d_2 \times y_2 + d_3 \times y_3 \\&= 10,985 \times 9,187 + 24 \times 9,187 + 5,492 \times 7,767 \\&= 364,063 \text{ Tm}\end{aligned}$$

h. Gaya Tekanan Tanah Akibat Gempa Bumi

$$PT_t = 54,753 \text{ T}$$

$$Ta = 54,753 \times 0,14 = 7,665 \text{ T}$$

$$YT_t = 3,800 \text{ m}$$

Momen terhadap titik B :

$$M_{TA} = 7,665 \times 3,800 = 29,127 \text{ Tm}$$

$$A = \frac{1}{4} \pi D^2 = 961,625 \text{ cm}^2 = 0,096125 \text{ m}^2$$

$$O = \pi D = 109,90 \text{ cm} = 1,099 \text{ m}$$

Dari data tanah diperoleh :

$$q_c = \frac{1}{2} (q_{cu} + q_{cb})$$

$$q_{cu} = q_c \text{ rata - rata } 3,5 D \text{ dibawah ujung tiang} = 206,667$$

$$q_{cb} = q_c \text{ rata - rata } 8 D \text{ diatas ujung tiang} = 145$$

$$q_c = \frac{1}{2} (206,667 + 145) = 175,835$$

$$JHP = 1300$$

$$P_{ult} = \frac{0,75 * 175,835 * 0,096125 + 0,75 * 1300 * 1,099}{3}$$

$$= 361,400 \text{ T}$$

- Rumus Trofimankof

$$P_{ult} = \frac{K_b * q_c * A + JHP / D * O}{SF}$$

$$D = 1,5$$

$$P_{ult} = \frac{0,75 * 175,835 * 0,096125 + (1300 / 1,5) * 1,099}{3}$$

$$= 321,708 \text{ T}$$

- Rumus S.P.T (Standard Penetration Test) untuk tanah pasir

$$Q_u = 40 \times N \times A_b + 0,2 \times N \times A_s$$

$$Q_u = \text{Daya Dukung Batas Tiang (ton)}$$

$$N = \text{Nilai rata - rata SPT sepanjang Tiang} = 60$$

$$A_s = \text{Luas Total Selimut Tiang (m}^2\text{)}$$

$$= \text{kell } O \times H \text{ tiang} = 1,099 \times 14 = 15,386 \text{ m}^2$$

$$A_b = \text{luas penampang ujung tiang (m}^2\text{)}$$

$$= \pi \cdot r (S + r) = 3,14 \times 0,175 (0,789 + 0,175) = 0,529 \text{ m}^2$$

$$Q_u = 40 \times 60 \times 0,529 + 0,2 \times 60 \times 15,386$$

$$= 1454,232 \text{ T}$$

$$Q_a = Q_u / SF = 1454,232 / 3 = 484,744 \text{ ton.}$$

- Rumus Meyerhof

$$Q_{ult} = 40 \times N \times A_b + \frac{N_x \times A_s}{5}$$

N = Nilai SPT ujung Tiang = 60

A_s = Luas Total Selimut Tiang (m²)

$$= \text{kell O} \times \text{H tiang} = 1,099 \times 14 = 15,386 \text{ m}^2$$

A_b = luas penampang ujung tiang (m²) = 0,529 m²

N_x = nilai rata rata SPT = 60

$$Q_{ult} = 40 \times 60 \times 0,529 + \frac{60 \times 15,386}{5}$$

$$Q_u = 1454,232 \text{ T}$$

$$Q_a = Q_u / SF = 1454,232 / 3 = 484,744 \text{ ton.}$$

◦ Rumus begemann

$$\begin{aligned} P_{ult} &= \frac{q_c \times A}{3} + \frac{JHP * O}{5} \\ &= \frac{175,835 \times 0,096125}{3} + \frac{1300 * 1,099}{5} \\ &= 291,374 \text{ T} \end{aligned}$$

Dari tinjauan diatas dipakai nilai daya dukung terkecil = 291,374 T

2. Daya Dukung Kelompok Tiang

Berdasarkan perumusan dari *converse labarre* :

$$\text{Eff} = 1 - \theta \left[\frac{(n-1)m + (m-1)n}{90 * m * n} \right]$$

Dimana :

m = jumlah tiang dalam baris y = 7

n = jumlah baris = 2

θ = arc tan θ (D/S) = arc tan (0,35/1,6) = 12,298°

D = diameter tiang = 35 cm

S = jarak antar tiang = 160 cm

$$\text{Eff} = 1 - 12,298 \left[\frac{(2-1)7 + (7-1)2}{90 * 7 * 2} \right]$$

$$= 0,815$$

Daya dukung tiap kelompok tiang pada kelompok tiang :

$$P_{all} = 291,374 \times 0,815 = 237,469 \text{ T}$$

Kontrol P_{all} terhadap P_{maks} yang terjadi :

$$P_{all} (237,469 \text{ T}) > P_{maks} (152,775 \text{ T}) \dots\dots\dots \text{OK}$$

5.3.3.2 Kontrol Gaya Horisontal
